

# Constructing Object oriented programs Which Design is Better?

## A Talk in CSE Seminar Series of 2007-2008 March 12, 2008, 2-3 pm

**Rushikesh K Joshi**

Department of Computer Science and Engineering  
Indian Institute of Technology Bombay

# Outline

- 1 Object Oriented Designs
- 2 Design Before Implementation?
- 3 A Methodology Problem
- 4 Actual Results on a Local Software
- 5 Further Design Improvements and Tool Support

# Outline

- 1 Object Oriented Designs
- 2 Design Before Implementation?
- 3 A Methodology Problem
- 4 Actual Results on a Local Software
- 5 Further Design Improvements and Tool Support

# Object Oriented Designs

Decomposition of the abstraction space

- Classes and Objects

Weave them through various relationships

The Goal?

- Core Functionality and
- Design Goodness Criteria

Object Oriented Designs

Design Before Implementation?

A Methodology Problem

Actual Results on a Local Software

Further Design Improvements and Tool Support

# The Development Paradigm

Design, Implementation

Model Driven Design and Extreme Programming

# Outline

- 1 Object Oriented Designs
- 2 Design Before Implementation?
- 3 A Methodology Problem
- 4 Actual Results on a Local Software
- 5 Further Design Improvements and Tool Support

# Design Alternatives

A designer may create many alternatives

What kinds of flaws may exist in designs?

let's look at some examples..

# A Dynamic Functionality Enhancement Problem

encryptor-->  
demarshaller-->

# Design Feature-1

Enhancers (Decorators) Enhance the Core Functionality

The core functionality is not removed

## Design Feature-2

Dynamic Pluggability – One should be able to attach and detach decorators dynamically

## Design Feature-3

Caller code independent of the difference that is being made to the quality of service

The calling application sees the same interface for decorator and end-server

## Design Feature-4

No. of decorators:  $0..n$

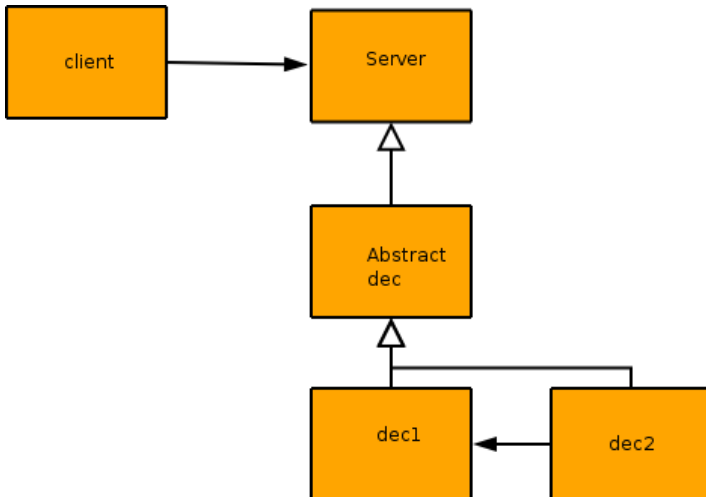

# Proposal 1

## Pros and Cons

- Okay for delegation based inheritance model (with a minor modification)
- Does not work with class-based inheritance
- Chaining of independent decorators at object level not achieved
- Decorators are bulky, redundancy- multiple copy problem

# Proposal 2

## Pros and Cons

- Chaining at object level
- interface compatibility
- Chaining does not scale up (cannot add more decorators)
- Decorators are bulky, redundancy- multiple copy problem

# Proposal 3

## Pros and Cons

- Confusion between caller and callee abstractions
- Member function invocations that go in project the interface, and not the invocations that come out

# Proposal 4

## Pros and Cons

- Generality among decorators captured
- Only one decorator at a time
- Server part of decorator

## Proposal 5

## Pros and Cons

- Generality among decorators captured
- Only one decorator at a time
- Server part of decorator
- Default Null Decorator– Is it necessary?

# Proposal 6

## Pros and Cons

- Server disconnected from decorator, caller:
- A Relation from server to decorator and not vice versa
- Dec1 part of Dec2

# Proposal 7

## Pros and Cons

- Comes close- decorators, servers are independent
- Only one decorator at a time, no chaining
- Commonality between decorators and server not captured

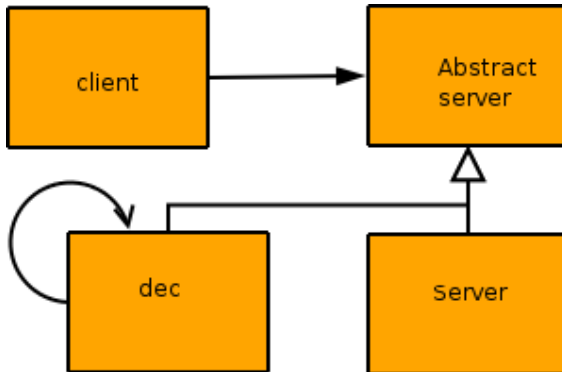

## Proposal 8

## Pros and Cons

- Recursive Chaining due recursion at generic level
- server is aware of decoration- Is outgoing chaining from the server needed?

## Proposal 9

## Pros and Cons

- Decorators are chained
- Only one decorator type benefits from the chaining
- Server has no outgoing links
- But decorators cannot connect to server

# Proposal 10

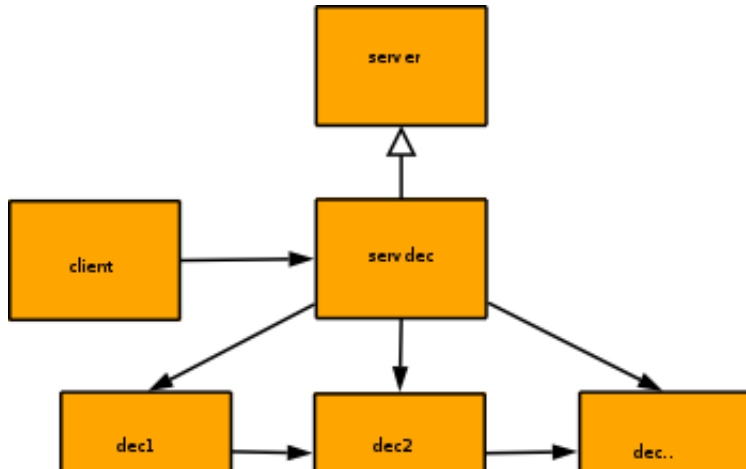

## Pros and Cons

- Commonality captured beautifully
- Chaining is static (type specific) since it's class-class chaining

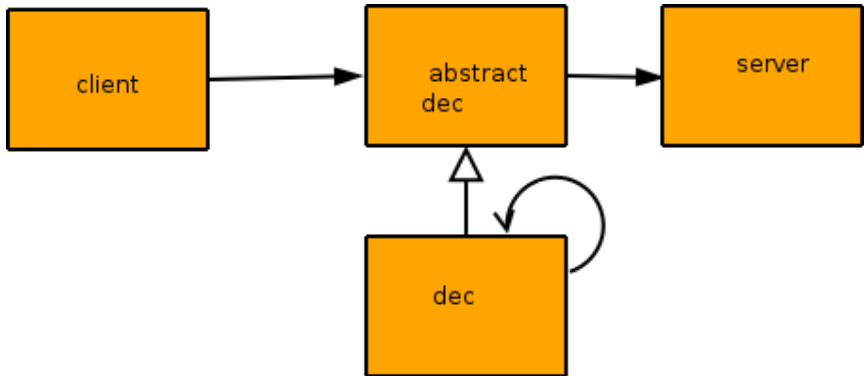

## Proposal 11

## Pros and Cons

- Commonality among decorators captured
- Decorators are not servers themselves
- The designer explicitly captured 3 possibilities-  
1-s,2-1-s,3-2-1-s
- Too many links, static chaining

## Proposal 12

## Pros and Cons

- Decorators chained
- Only one type of chained decorator
- Commonality between decorators and server not captured

## Proposal 13

## Pros and Cons

- Top level decorator knows of the rest
- Front decorator is also server, the rest are not
- Rest of the decorators cannot be used independently, two interfaces

## Proposal 14

## Pros and Cons

- Decorators chained
- Every decorator is also a server
- Only one type of decorator benefits from chaining
- Cannot add subclasses- with chaining between instances of existing classes and the newly added subclass, the design will get messed up

## Proposal 15

## Pros and Cons

- Decorators chained generically
- Decorators cannot reach the server
- Commonality between decorators and the server not captured

# Proposal 16

## Pros and Cons

- Looks more like an object model than class model
- Front decorator knows of the rest of the decorators and the server
- Cannot add a new decorator without modifying the existing front class's state and code

## Proposal 17

## Pros and Cons

- Recursive chaining captured through upward links+inheritance
- All decorators are servers
- Genericity in chaining not captured

## Proposal 18

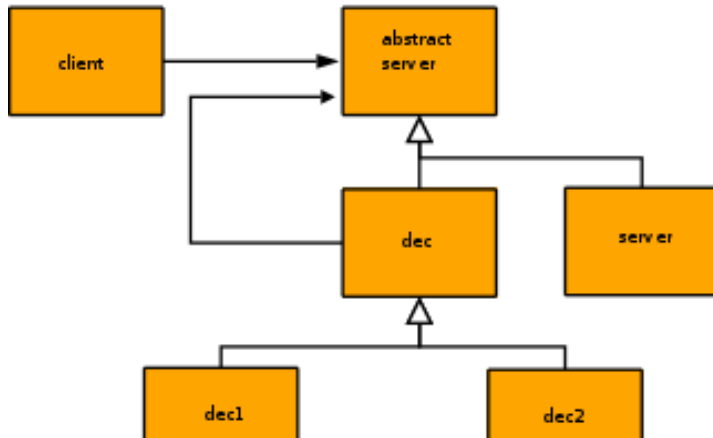

## Pros and Cons

- Quite close!
- Decorators chained at generic level
- The fact that each decorator may have at most one downlink is not captured generically

## Proposal 19

## Pros and Cons

- Decorators chained at generic level
- The fact that each decorator may have at most one downlink is captured generically through an intermediate abstraction

## Structural Properties of the Last Solution

- Server instance is the end object in a chain
- Decorators and Servers share the same abstraction
- New decorator benefits from chaining captured at a generic level
- Decorator chaining configuration is not statically committed

## Front Deletion: still a problem

- Client needs to be contacted for deleting or replacing the front decorator
- Having a default front is an overhead when decorators are not used
- To solve this problem:  
What's needed is location transparency

# Outline

- 1 Object Oriented Designs
- 2 Design Before Implementation?
- 3 A Methodology Problem**
- 4 Actual Results on a Local Software
- 5 Further Design Improvements and Tool Support

## Summary

*Design before Implementation* requires a careful analysis of the design, if the design should sail straight into implementation

- Capture the properties that are desirable
- Do not capture the properties that are undesirable

*An extreme approach creates more problems as the system evolves..*

*especially when refactorings are not applied continuously!*

# Outline

- 1 Object Oriented Designs
- 2 Design Before Implementation?
- 3 A Methodology Problem
- 4 Actual Results on a Local Software**
- 5 Further Design Improvements and Tool Support

## Impact of Design Improvement

class name	NOM before	LOC before	NOM after	LOC after
UpApplicant	50	1776	50+11	1118
ConnectDatabase	10	265	10	220
MtechApplicationInit	33	565	33+3	450
MtechApplication	8	339	8	300
MtechMailer	3	60	3	60
StatusMailer	1	35	1	35
ValidationChoice	7	131	7+4	114
ImpData	0	35	0	35
Constants	0	6	0	6
Total	0	6	0	6

Significant improvement in LOC mainly by method extraction  
and no major design changes were applied

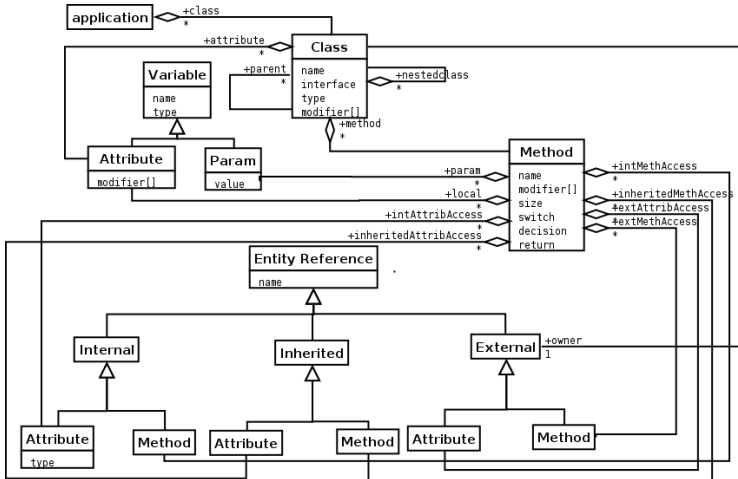

# Outline

- 1 Object Oriented Designs
- 2 Design Before Implementation?
- 3 A Methodology Problem
- 4 Actual Results on a Local Software
- 5 Further Design Improvements and Tool Support

# Measuring Designs and Code for Cohesion and Coupling

- Cohesion and Coupling
- Apply Structural Metrics to detect problem areas
- There are Many Metrics and they need structural information
  - An intermediate representation for OO programs— metric friendly
- Metrics are mainly class-based— they donot pinpoint problem methods
  - Microscopic Metrics

# A Compact Model for Measuring Designs and Code

## Limitations of Object orientation

- Advanced Separation of Concerns (beyond what can be expressed in OOP)
- Code is redundant, but cannot be modularized
- Capture such code through aspects and weave them with bases
- Need to Measure the goodness of Aspectized Code → Metrics for AOP
