

Workshop on Essential Abstractions in GCC

Spim Machine Descriptions: Levels 0 and 1

GCC Resource Center
(www.cse.iitb.ac.in/grc)

Department of Computer Science and Engineering,
Indian Institute of Technology, Bombay

July 2010

Outline

- Systematic construction of machine descriptions
- Retargetting GCC to spim
 - ▶ spim is mips simulator developed by James Larus
 - ▶ RISC machine
 - ▶ Assembly level simulator: No need of assembler, linkers, or libraries
- Level 0 of spim machine descriptions
- Level 1 of spim machine descriptions

Part 1

Systematic Construction of Machine Descriptions

In Search of Modularity in Retargetable Compilation

In Search of Modularity in Retargetable Compilation

In Search of Modularity in Retargetable Compilation

In Search of Modularity in Retargetable Compilation

In Search of Modularity in Retargetable Compilation

Systematic Development of Machine Descriptions

Systematic Development of Machine Descriptions

- Define different levels of source language
- Identify the minimal information required in the machine description to support each level
 - ▶ Successful compilation of any program, and
 - ▶ correct execution of the generated assembly program.
- Interesting observations
 - ▶ It is the increment in the source language which results in understandable increments in machine descriptions rather than the increment in the target architecture.
 - ▶ If the levels are identified properly, the increments in machine descriptions are monotonic.

Part 3

Retargeting GCC to Spim: A Recap

Retargeting GCC to Spim

- Registering spim target with GCC build process
- Making machine description files available
- Building the compiler

Registering Spim with GCC Build Process

We want to add multiple descriptions:

- Step 1. In the file `$(SOURCE)/config.sub`
Add to the `case $basic_machine`
 - ▶ `spim*` in the part following
Recognize the basic CPU types without company name.
 - ▶ `spim*-*` in the part following
Recognize the basic CPU types with company name.

Registering Spim with GCC Build Process

- Step 2a. In the file `$(SOURCE_D)/gcc/config.gcc`

In `case ${target}` used for defining `cpu_type`, i.e. after the line
`# Set default cpu_type, tm_file, tm_p_file and xm_file ...`

add the following case

```
spim*-*-*)  
    cpu_type=spim  
    ;;
```

This says that the machine description files are available in the directory `$(SOURCE_D)/gcc/config/spim`.

Registering Spim with GCC Build Process

- Step 2b. In the file `$(SOURCE_D)/gcc/config.gcc`

Add the following in the `case ${target}` for
Support site-specific machine types.

```
spim*-*-*)  
    gas=no  
    gnu_ld=no  
    file_base="'echo ${target} | sed 's/-.*$//'"  
    tm_file="${cpu_type}/${file_base}.h"  
    md_file="${cpu_type}/${file_base}.md"  
    out_file="${cpu_type}/${file_base}.c"  
    tm_p_file="${cpu_type}/${file_base}-protos.h"  
    echo ${target}  
    ;;
```

Building a Cross-Compiler for Spim

- Normal cross compiler build process attempts to use the generated cc1 to compile the emulation libraries (LIBGCC) into executables using the assembler, linker, and archiver.
- We are interested in only the cc1 compiler.
Add a new target in the Makefile.in

```
.PHONY: cc1
```

```
cc1:
```

```
    make all-gcc TARGET-gcc=cc1$(exeext)
```

Building a Cross-Compiler for Spim

- Create directories `${BUILD_D}` and in a tree not rooted at `${SOURCE_D}`.
- Change the directory to `${BUILD_D}` and execute the commands

```
$ cd ${BUILD_D}
```

```
$ ${SOURCE_D}/configure --target=spim<n>
```

```
$ make cc1
```

- Pray for 10 minutes :-)

Part 4

Level 0 of Spim Machine Descriptions

Sub-levels of Level 0

Three sub-levels

- Level 0.0: Merely build GCC for spim simulator
Does not compile any program (i.e. compilation aborts)
- Level 0.1: Compiles empty void functions

```
void fun(int p1, int p2)
{
    int v1, v2;
}
```

```
void fun()
{
    L: goto L;
}
```

- Level 0.2: Incorporates complete activation record structure
Required for Level 1

Category of Macros in Level 0

Category	Level 0.0	Level 0.1	Level 0.2
Memory Layout	complete	complete	complete
Registers	partial	partial	complete
Addressing Modes	none	partial	partial
Activation Record Conventions	dummy	dummy	complete
Calling Conventions	dummy	dummy	partial
Assembly Output Format	dummy	partial	partial

- Complete specification of activation record in level 0.2 is not necessary but is provided to facilitate local variables in level 1.
- Complete specification of registers in level 0.2 follows the complete specification of activation record.

Memory Layout Related Macros for Level 0

```
#define BITS_BIG_ENDIAN 0
```

```
#define BYTES_BIG_ENDIAN 0
```

```
#define WORDS_BIG_ENDIAN 0

Minimizing Registers for Accessing Activation Records

Reduce four pointer registers (stack, frame, args, and hard frame) to fewer registers.

```
#define ELIMINABLE_REGS
{{FRAME_POINTER_REGNUM,      STACK_POINTER_REGNUM},
 {FRAME_POINTER_REGNUM,      HARD_FRAME_POINTER_REGNUM},
 {ARG_POINTER_REGNUM,        STACK_POINTER_REGNUM},
 {HARD_FRAME_POINTER_REGNUM, STACK_POINTER_REGNUM}}
}
```

/Recomputes new offsets, after eliminating./

```
#define INITIAL_ELIMINATION_OFFSET(FROM, TO, VAR)
    (VAR) = initial_elimination_offset(FROM, TO)
```

Specifying Activation Record

```
#define STARTING_FRAME_OFFSET  starting_frame_offset ()

#define FIRST_PARM_OFFSET(FUN) 0

#define STACK_POINTER_REGNUM 29

#define FRAME_POINTER_REGNUM 1

#define HARD_FRAME_POINTER_REGNUM 30

#define ARG_POINTER_REGNUM HARD_FRAME_POINTER_REGNUM

#define FRAME_POINTER_REQUIRED 0
```

Part 5

Level 1 of Spim Machine Descriptions

Increments for Level 1

- Addition to the source language
 - ▶ Assignment statements involving integer constant, integer local or global variables.
 - ▶ Returning values. (No calls, though!)
- Changes in machine descriptions
 - ▶ Minor changes in macros required for level 0
\$zero now belongs to new class Assembly output needs to change
 - ▶ Some function bodies expanded
 - ▶ New operations included in the .md file

`diff -w` shows the changes!

Operations Required in Level 1

Operation	Primitive Variants	Implementation	Remark
$Dest \leftarrow Src$	$R_i \leftarrow R_j$	move rj, ri	
	$R \leftarrow M_{global}$	lw r, m	
	$R \leftarrow M_{local}$	lw r, c(\$fp)	
	$R \leftarrow C$	li r, c	
	$M \leftarrow R$	sw r, m	
RETURN Src	RETURN Src	$\$v0 \leftarrow Src$ j \$ra	level 0
$Dest \leftarrow Src_1 + Src_2$	$R_i \leftarrow R_j + R_k$	add ri, rj, rk	
	$R_i \leftarrow R_j + C$	addi ri, rj, c	

Move Operations in spim1.md

- Multiple primitive variants require us to map a single operation in IR to multiple RTL patterns
⇒ use `define_expand`
- Ensure that the second operand is in a register

```
(define_expand "movsi"
  [(set (match_operand:SI 0 "nonimmediate_operand" "")
        (match_operand:SI 1 "general_operand" ""))]
  "")
{ if(GET_CODE(operands[0])==MEM &&
    GET_CODE(operands[1])!=REG &&
    (can_create_pseudo_p())) /* force conversion only */
    /* before register allocation */
  { operands[1]=force_reg(SImode,operands[1]); }
}
```

Move Operations in spim1 Compiler for Assignment a = b

```

(define_expand "movsi"
  [(set (match_operand:SI 0 "nonimmediate_operand" "")
        (match_operand:SI 1 "general_operand" ""))
  ])
""
{ if (GET_CODE(operands[0]) == MEM &&
      GET_CODE(operands[1]) != REG &&
      (can_create_pseudo_p()) /* force conversion only */
      /* before register allocation */
      { operands[1] = force_reg(SImode, operands[1]); }
  }
)

(insn 6 5 7 3 t.c:25 (set (reg:SI 38)
  (mem/c/i:SI (plus:SI (reg/f:SI 33 virtual-stack-vars)
    (const_int -4 [0xffffffffc])) [0 b+0 S4 A32])) -1 (nil))
(insn 7 6 8 3 t.c:25 (set (mem/c/i:SI (plus:SI (reg/f:SI 33 virtual-stack-vars)

    (const_int -8 [0xffffffff8])) [0 a+0 S4 A32])
    (reg:SI 38)) -1 (nil))
```

- Generated Code

```
lw $v0, -16($fp)
```

Code Generation in spim1 Compiler for Assignment a = b

- RTL statements

```
(insn 6 5 7 3 t.c:25 (set (reg:SI 38)
      (mem/c/i:SI (plus:SI (reg/f:SI 33 virtual-stack-vars)
        (const_int -4 [0xffffffffc])) [0 b+0 S4 A32])) -
(insn 7 6 8 3 t.c:25 (set (mem/c/i:SI (plus:SI (reg/f:SI 33 virtual-stack-vars)
      (const_int -8 [0xffffffff8])) [0 a+0 S4 A32])
      (reg:SI 38)) -1 (nil))
```

- Generated Code

```
lw $v0, -16($fp)
sw $v0, -20($fp)
```

Using register \$zero for constant 0

- Introduce new register class `zero_register_operand` in `spim1.h` and define `move_zero`

```
(define_insn "IITB_move_zero"
  [(set (match_operand:SI 0 "nonimmediate_operand" "=r,m")
        (match_operand:SI 1 "zero_register_operand" "z,z")
      )]
  ""
  "@
  move \t%0,%1
  sw \t%1, %m0"
)
```

- How do we get `zero_register_operand` in an RTL?

Using register \$zero for constant 0

- Use `define_expand "movsi"` to get `zero_register_operand` in an RTL

```
if(GET_CODE(operands[1])==CONST_INT && INTVAL(operands[1])==0)
{
    emit_insn(gen_IITB_move_zero(operands[0],
                                   gen_rtx_REG(SImode,0)));
    DONE;
}
else /* Usual processing */
```

- DONE says do not generate the RTL template associated with "movsi"
- required template is generated by `emit_insn(gen_IITB_move_zero(...))`

Supporting Addition in Level 1

```
(define_insn "addsi3"
  [(set (match_operand:SI 0 "register_operand" "=r,r")
        (plus:SI (match_operand:SI 1 "register_operand" "r,r")
                  (match_operand:SI 2 "nonmemory_operand" "r,i")))
  ])
""
"@
add \t%0, %1, %2
addi \t%0, %1, %c2"
)
```

- Constraints combination 1 of three operands: R, R, R
- Constraints combination 2 of three operands: R, R, C

Comparing `movsi` and `addsi3`

- `movsi` uses `define_expand` whereas `addsi3` uses combination of operands
- Why not use constraints for `movsi` too?

Comparing `movsi` and `addsi3`

- `movsi` uses `define_expand` whereas `addsi3` uses combination of operands
- Why not use constraints for `movsi` too?
- `movsi` combines loads and stores
 - ▶ Thus we will need to support memory as both source and destination

Comparing `movsi` and `addsi3`

- `movsi` uses `define_expand` whereas `addsi3` uses combination of operands
- Why not use constraints for `movsi` too?
- `movsi` combines loads and stores
 - ▶ Thus we will need to support memory as both source and destination
 - ▶ Will also allow memory to memory move
Not supported by the machine!

Choices for Mapping Compound Operations to Primitive Operations

GIMPLE Operation	First RTL	RTL for Scheduling	Assembly	MD Construct
Compound	Split	Split	Split	define_expand
Compound	Compound	Split	Split	define_split
Compound	Compound	Compound	Split	ASM string

- `define_expand` may be used for selecting one alternative from among multiple possibilities at the time of first RTL generation.
- `@` in ASM string achieves the same effect at the time of emitting assembly instruction.
