Workshop on Essential Abstractions in GCC

The Retargetability Model of GCC

GCC Resource Center

(www.cse.iitb.ac.in/grc)

Department of Computer Science and Engineering, Indian Institute of Technology, Bombay

2 July 2011

Part 1

A Recap

2 July 2011 Retargetability Model: Outline 1/16

Outline

- A Recap
- Generating the code generators
- Using the generator code generators

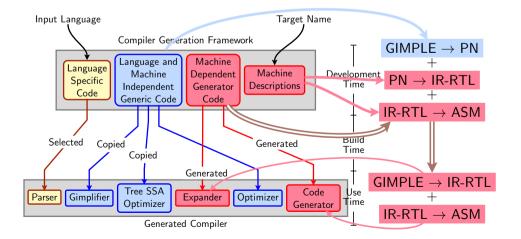

Essential Abstrations in GCC

2 July 2011

2/16

Retargetability Mechanism of GCC

Retargetability Model: A Recap

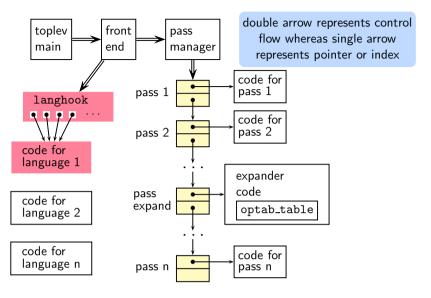

Essential Abstrations in GCC

3/16

5/16

Retargetability Model: A Recap Plugin Structure in cc1

Essential Abstrations in GCC

GCC Resource Center, IIT Bombay

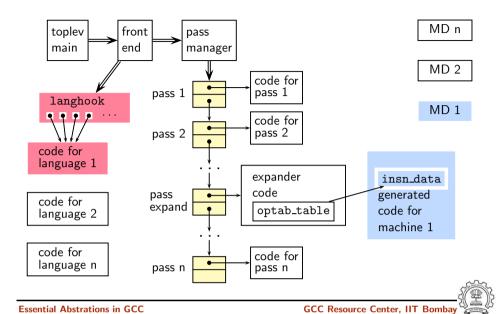

2 July 2011 Retargetability Model: A Recap

4/16

What is "Generated"?

- Info about instructions supported by chosen target, e.g.
 - ► Listing data structures (e.g. instruction pattern lists)
 - ▶ Indexing data structures, since diff. targets give diff. lists.
- C functions that generate RTL internal representation
- Any useful "attributes", e.g.
 - ► Semantic groupings: arithmetic, logical, I/O etc.
 - ▶ Processor unit usage groups for pipeline utilisation

Plugin Structure in cc1

2 July 2011

Retargetability Model: A Recap Information supplied by the MD

- The target instructions as ASM strings
- A description of the semantics of each
- A description of the features of each like
 - ► Data size limits
 - ▶ One of the operands must be a register
 - Implicit operands
 - ► Register restrictions

Information supplied	in define_insn as
The target instruction	ASM string
A description of it's semantics	RTL Template
Operand data size limits	predicates
Register restrictions	constraints

Part 2

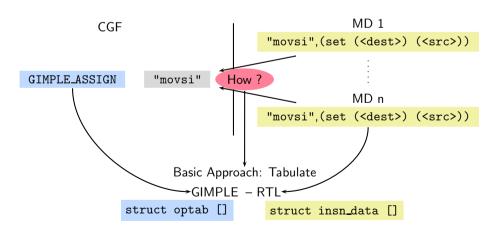

Generating the Code Generators

2 July 2011

Retargetability Model: Generating the Code Generators

7/16

Retargetability ⇒ Multiple MD vs. One CGF!

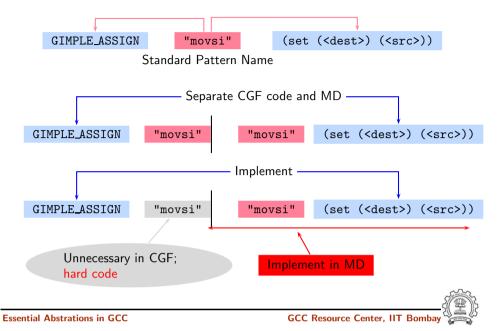

CGF needs:

An interface immune to MD authoring variations

How GCC uses target specific RTL as IR

2 July 2011

Retargetability Model: Generating the Code Generators

8/16

MD Information Data Structures

Two principal data structures

- struct optab Interface to CGF
- struct insn_data All information about a pattern
 - ► Array of each pattern read
 - Some patterns are SPNs
 - ▶ Each pattern is accessed using the generated index

Supporting data structures

• enum insn_code: Index of patterns available in the given MD

Note

Data structures are named in the CGF, but populated at build time. Generating target specific code = populating these data structures.

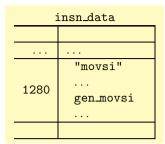

Retargetability Model: Generating the Code Generators

\$(SOURCE_D)/gcc/optabs.h
\$(SOURCE_D)/gcc/optabs.c

optab_table mov_optab handler OTI_mov insn_code SI insn_code

\$(BUILD)/gcc/insn-output.c

\$BUILD/gcc/insn-codes.h

CODE_FOR_movsi=1280 CODE_FOR_movsf=CODE_FOR_nothing

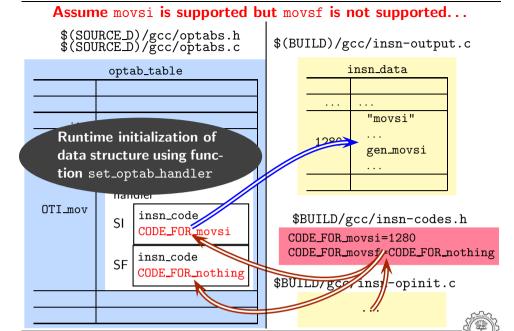

\$BUILD/gcc/insn-opinit.c

Essential Abstrations in GCC

GCC Resource Center, IIT Bomba

2 July 2011 Retargetability Model: Generating the Code Generators 10/16

GCC Generation Phase – Revisited			
Generator	Generated from MD	Information	Description
genopinit	insn-opinit.c	<pre>void init_all_optabs (void);</pre>	Operations Table Initialiser
gencodes	insn-codes.h	<pre>enum insn_code = { CODE_FOR_movsi = 1280, }</pre>	Index of patterns
genooutput	insn-output.c	struct insn_data [CODE].genfun = /* fn ptr */	All insn data e.g. gen function
genemit	insn-emit.c	rtx gen_rtx_movsi (/* args */) {/* body */}	RTL emission functions

2 July 2011

Essential Abstrations in GCC

Retargetability Model: Generating the Code Generators

11/16

Explicit Calls to gen<SPN> functions

- In some cases, an entry is not made in insn_data table for some SPNs.
- gen functions for such SPNs are explicitly called.
- These are mostly related to
 - Function calls
 - Setting up of activation records
 - Non-local jumps

Essential Abstrations in GCC

etc. (i.e. deeper study is required on this aspect)

GCC Resource Center, IIT Bomb

Handling C Code in define_expand

```
(define_expand "movsi"
   [(set (op0) (op1))]
       /* C CODE OF DEFINE EXPAND */
rtx
gen_movsi (rtx operand0, rtx operand1)
{
       /* C CODE OF DEFINE EXPAND */
  emit_insn (gen_rtx_SET (VOIDmode, operand0, operand1)
```

Essential Abstrations in GCC

Essential Abstrations in GCC

2 July 2011

Retargetability Model: Using the Code Generators

cc1 Control Flow: GIMPLE to RTL Expansion (pass_expand)

```
gimple_expand_cfg
  expand_gimple_basic_block(bb)
     expand_gimple_cond(stmt)
     expand_gimple_stmt(stmt)
         expand_gimple_stmt_1 (stmt)
             expand_expr_real_2
                expand_expr /* Operands */
                    expand_expr_real
                optab_for_tree_code
                expand_binop /* Now we have rtx for operands */
                   expand_binop_directly
                     /* The plugin for a machine */
                     code=optab_handler(binoptab,mode)
                     GEN_FCN
                     emit_insn
```

Part 3

Using the Code Generators

2 July 2011

Retargetability Model: Using the Code Generators

14/16

RTL Generation

```
expand_binop_directly
   ... /* Various cases of expansion */
/* One case: integer mode move */
icode = mov_optab->handler[SImode].insn_code
if (icode != CODE_FOR_nothing) {
   ... /* preparatory code */
   emit_insn (GEN_FCN(icode)(dest,src));
```

RTL to **ASM** Conversion

- Simple pattern matching of IR RTLs and the patterns present in all named, un-named, standard, non-standard patterns defined using define_insn.
- A DFA (deterministic finite automaton) is constructed and the first match is used.

ource Center, IIT Bombay

Essential Abstrations in GCC

2 July 2011

Retargetability Model: Conclusions

16/16

A Comparison with Davidson Fraser Model

- Retargetability in Davidson Fraser Model
 - ► Manually rewriting Expander and patter matcher
 - ► Expected to be simple for machines of 1984 Era
- Retargetability in GCC
 Automatic construction possible by separating machine specific details in carefully designed data structures
 - ▶ List insns as they appear in the chosen MD
 - ▶ Index them
 - Supply index to the CGF

Part 4

Conclusions
