

Manipulating GIMPLE and RTL IRs

GCC Resource Center
(www.cse.iitb.ac.in/grc)

Department of Computer Science and Engineering,
Indian Institute of Technology, Bombay

1 July 2012

- An Overview of GIMPLE
- Using GIMPLE API in GCC-4.6.0
- Adding a GIMPLE Pass to GCC
- An Internal View of RTL
- Manipulating RTL IR

Notes

Part 1

An Overview of GIMPLE

1 July 2012

GIMPLE and RTL: An Overview of GIMPLE

2/39

GIMPLE: A Recap

- Language independent three address code representation
 - ▶ Computation represented as a sequence of basic operations
 - ▶ Temporaries introduced to hold intermediate values
- Control construct explicated into conditional and unconditional jumps

Notes

1 July 2012

GIMPLE and RTL: An Overview of GIMPLE

2/39

GIMPLE: A Recap

Notes

Motivation Behind GIMPLE

- Previously, the only common IR was RTL (Register Transfer Language)
- Drawbacks of RTL for performing high-level optimizations
 - ▶ Low-level IR, more suitable for machine dependent optimizations (e.g., peephole optimization)
 - ▶ High level information is difficult to extract from RTL (e.g. array references, data types etc.)
 - ▶ Introduces stack too soon, even if later optimizations do not require it

Why Not Abstract Syntax Trees for Optimization?

- ASTs contain detailed function information but are not suitable for optimization because
 - ▶ **Lack of a common representation across languages**
 - ▶ No single AST shared by all front-ends
 - ▶ So each language would have to have a different implementation of the same optimizations
 - ▶ Difficult to maintain and upgrade so many optimization frameworks
 - ▶ **Structural Complexity**
 - ▶ Lots of complexity due to the syntactic constructs of each language
 - ▶ Hierarchical structure and not linear structure
 - ▶ Control flow explication is required

Motivation Behind GIMPLE

Notes

Why Not Abstract Syntax Trees for Optimization?

Notes

Need for a New IR

- Earlier versions of GCC would build up trees for a single statement, and then lower them to RTL before moving on to the next statement
- For higher level optimizations, entire function needs to be represented in trees in a language-independent way.
- Result of this effort - GENERIC and GIMPLE

What is GENERIC?

What?

- Language independent IR for a complete function in the form of trees
- Obtained by removing language specific constructs from ASTs
- All tree codes defined in `$(SOURCE)/gcc/tree.def`

Why?

- Each language frontend can have its own AST
- Once parsing is complete they must emit GENERIC

Need for a New IR

Notes

What is GENERIC?

Notes

What is GIMPLE ?

- GIMPLE is influenced by SIMPLE IR of McCat compiler
- But GIMPLE is not same as SIMPLE (GIMPLE supports GOTO)
- It is a simplified subset of GENERIC
 - ▶ 3 address representation
 - ▶ Control flow lowering
 - ▶ Cleanups and simplification, restricted grammar
- Benefit : Optimizations become easier

GIMPLE Goals

The Goals of GIMPLE are

- Lower control flow
Sequenced statements + conditional and unconditional jumps
- Simplify expressions
Typically one operator and at most two operands
- Simplify scope
Move local scope to block begin, including temporaries

What is GIMPLE ?

Notes

GIMPLE Goals

Notes

Tuple Based GIMPLE Representation

- Earlier implementation of GIMPLE used trees as internal data structure
- Tree data structure was much more general than was required for three address statements
- Now a three address statement is implemented as a tuple
- These tuples contain the following information
 - ▶ Type of the statement
 - ▶ Result
 - ▶ Operator
 - ▶ Operands

The result and operands are still represented using trees

Observing Internal Form of GIMPLE

test.c.004t.gimple
with compilation option
-fdump-tree-all

```
x = 10;
y = 5;
D.1954 = x * y;
a.0 = a;
x = D.1954 + a.0;
a.1 = a;
D.1957 = a.1 * x;
y = y - D.1957;
```

test.c.004t.gimple with compilation option
-fdump-tree-all-raw

```
gimple_assign <integer_cst, x, 10, NULL>
gimple_assign <integer_cst, y, 5, NULL>
gimple_assign <mult_expr, D.1954, x, y>
gimple_assign <var_decl, a.0, a, NULL>
gimple_assign <plus_expr, x, D.1954, a.0>
gimple_assign <var_decl, a.1, a, NULL>
gimple_assign <mult_expr, D.1957, a.1, x>
gimple_assign <minus_expr, y, y, D.1957>
```

Tuple Based GIMPLE Representation

Notes

Observing Internal Form of GIMPLE

Notes

Observing Internal Form of GIMPLE

```
test.c.004t.gimple  
with compilation option  
-fdump-tree-all
```

```
if (a < c)  
  goto <D.1953>;  
else  
  goto <D.1954>;  
<D.1953>:  
  a = b + c;  
  goto <D.1955>;  
<D.1954>:  
  a = b - c;  
<D.1955>:
```

```
test.c.004t.gimple with compilation option  
-fdump-tree-all-raw
```

```
gimple_cond <lt_expr, a,c,<D.1953>, <D.1954>>  
gimple_label <<D.1953>>  
gimple_assign <plus_expr, a, b, c>  
gimple_goto <<D.1955>>  
gimple_label <<D.1954>>  
gimple_assign <minus_expr, a, b, c>  
gimple_label <<D.1955>>
```

Other Useful APIs for Manipulating GIMPLE

Extracting parts of GIMPLE statements:

- `gimple_assign_lhs`: left hand side
- `gimple_assign_rhs1`: left operand of the right hand side
- `gimple_assign_rhs2`: right operand of the right hand side
- `gimple_assign_rhs_code`: operator on the right hand side

A complete list can be found in the file [gimple.h](#)

Discovering More Information from GIMPLE

- Discovering local variables
- Discovering global variables
- Discovering pointer variables
- Discovering assignment statements involving pointers
(i.e. either the result or an operand is a pointer variable)

The first two are relevant to your lab assignment

The other two constitute an example of a complete pass

GIMPLE and RTL: An Overview of RTL

24/39

What is RTL ?

RTL = Register Transfer Language

Assembly language for an abstract machine with infinite registers

1 July 2012

GIMPLE and RTL: An Overview of RTL

24/39

What is RTL ?

Notes

Why RTL?

A lot of work in the back-end depends on RTL. Like,

- Low level optimizations like loop optimization, loop dependence, common subexpression elimination, etc
- Instruction scheduling
- Register Allocation
- Register Movement

Why RTL?

For tasks such as those, RTL supports many low level features, like,

- Register classes
- Memory addressing modes
- Word sizes and types
- Compare and branch instructions
- Calling Conventions
- Bitfield operations

Why RTL?

Notes

Why RTL?

Notes

The Dual Role of RTL

- For specifying machine descriptions

Machine description constructs:

- ▶ `define_insn`, `define_expand`, `match_operand`

- For representing program during compilation

IR constructs

- ▶ `insn`, `jump_insn`, `code_label`, `note`, `barrier`

This lecture focusses on RTL as an IR

Part 4

An Internal View of RTL

The Dual Role of RTL

Notes

Notes

RTL Objects

- Types of RTL Objects
 - ▶ Expressions
 - ▶ Integers
 - ▶ Wide Integers
 - ▶ Strings
 - ▶ Vectors
- Internal representation of RTL Expressions
 - ▶ Expressions in RTX are represented as trees
 - ▶ A pointer to the C data structure for RTL is called `rtl`

RTL Codes

RTL Expressions are classified into RTX codes :

- Expression codes are [names](#) defined in [rtl.def](#)
- RTX codes are C enumeration constants
- Expression codes and their meanings are [machine-independent](#)
- Extract the code of a RTX with the macro `GET_CODE(x)`

RTL Objects

Notes

RTL Codes

Notes

RTL Classes

RTL expressions are divided into few classes, like:

- RTX_UNARY : NEG, NOT, ABS
- RTX_BIN_ARITH : MINUS, DIV
- RTX_COMM_ARITH : PLUS, MULT
- RTX_OBJ : REG, MEM, SYMBOL_REF
- RTX_COMPARE : GE, LT
- RTX_TERNARY : IF_THEN_ELSE
- RTX_INSN : INSN, JUMP_INSN, CALL_INSN
- RTX_EXTRA : SET, USE

RTL Codes

The RTL codes are defined in `rtl.def` using cpp macro call `DEF_RTL_EXPR`, like :

- `DEF_RTL_EXPR(INSN, "insn", "iuuBieie", RTX_INSN)`
- `DEF_RTL_EXPR(SET, "set", "ee", RTX_EXTRA)`
- `DEF_RTL_EXPR(PLUS, "plus", "ee", RTX_COMM_ARITH)`
- `DEF_RTL_EXPR(IF_THEN_ELSE, "if_then_else", "eee", RTX_TERNARY)`

The operands of the macro are :

- Internal name of the `rtl` used in C source. It's a tag in enumeration `enum rtl_code`
- name of the `rtl` in the external ASCII format
- Format string of the `rtl`, defined in `rtl_format[]`
- Class of the `rtl`

RTL Classes

Notes

RTL Codes

Notes

RTL Formats

```
DEF_RTL_EXPR(INSN, "insn", "iuuBieie", RTX_INSN)
```

- i : Integer
- u : Integer representing a pointer
- B : Pointer to basic block
- e : Expression

RTL statements

- RTL statements are instances of type `rtx`
- RTL insns contain embedded links
- Types of RTL insns :
 - ▶ `INSN` : Normal non-jumping instruction
 - ▶ `JUMP_INSN` : Conditional and unconditional jumps
 - ▶ `CALL_INSN` : Function calls
 - ▶ `CODE_LABEL`: Target label for `JUMP_INSN`
 - ▶ `BARRIER` : End of control Flow
 - ▶ `NOTE` : Debugging information

RTL Formats

Notes

RTL statements

Notes

Basic RTL APIs

- XEXP, XINT, XWINT, XSTR
 - ▶ Example: XINT(x, 2) accesses the 2nd operand of rtx x as an integer
 - ▶ Example: XEXP(x, 2) accesses the same operand as an expression
- Any operand can be accessed as any type of RTX object
 - ▶ So operand accessor to be chosen based on the format string of the containing expression
- Special macros are available for Vector operands
 - ▶ XVEC(exp, idx) : Access the vector-pointer which is operand number idx in exp
 - ▶ XVECLEN (exp, idx) : Access the length (number of elements) in the vector which is in operand number idx in exp. This value is an int
 - ▶ XVECEXP (exp, idx, eltnum) : Access element number "eltnum" in the vector which is in operand number idx in exp. This value is an RTX

RTL Insns

- A function's code is a doubly linked chain of INSN objects
- Insns are rtxs with special code
- Each insn contains atleast 3 extra fields :
 - ▶ Unique id of the insn , accessed by INSN_UID(i)
 - ▶ PREV_INSN(i) accesses the chain pointer to the INSN preceding i
 - ▶ NEXT_INSN(i) accesses the chain pointer to the INSN succeeding i
- The first insn is accessed by using get_insns()
- The last insn is accessed by using get_last_insn()

Basic RTL APIs

Notes

RTL Insns

Notes

Part 5

Manipulating RTL IR

Notes

1 July 2012

GIMPLE and RTL: Manipulating RTL IR

36/39

Adding an RTL Pass

1 July 2012

GIMPLE and RTL: Manipulating RTL IR

36/39

Adding an RTL Pass

Similar to adding GIMPLE intraprocudural pass except for the following

- Use the data structure `struct rtl_opt_pass`
- Replace the first field `GIMPLE_PASS` by `RTL_PASS`

Notes

Sample Demo Program

Problem statement : Counting the number of SET objects in a basic block by adding a new RTL pass

- Add your new pass after `pass_expand`
- `new_rtl_pass_main` is the main function of the pass
- Iterate through different instructions in the doubly linked list of instructions and for each expression, call `eval_rtx(insn)` for that expression which recurse in the expression tree to find the set statements

Sample Demo Program

```
int new_rtl_pass_main(void){
  basic_block bb;
  rtx last,insn,opd1,opd2;
  int bbno,code,type;
  count = 0;
  for (insn=get_insns(), last=get_last_insn(),
       last=NEXT_INSN(last); insn!=last; insn=NEXT_INSN(insn))
  {
    int is_insn;
    is_insn = INSN_P (insn);
    if(flag_dump_new_rtl_pass)
      print_rtl_single(dump_file,insn);
    code = GET_CODE(insn);
    if(code==NOTE){ ... }
    if(is_insn)
    {
      rtx subexp = XEXP(insn,5);
      eval_rtx(subexp);
    }
  }
  ...
}
```

Sample Demo Program

Notes

Sample Demo Program

Notes

Sample Demo Program

```
void eval_rtx(rtx exp)
{ rtx temp;
  int veclen,i,
  int rt_code = GET_CODE(exp);
  switch(rt_code)
  {   case SET:
      if(flag_dump_new_rtl_pass){
          fprintf(dump_file,"\nSet statement %d : \t",count+1);
          print_rtl_single(dump_file,exp);}
      count++; break;
    case PARALLEL:
      veclen = XVECLEN(exp, 0);
      for(i = 0; i < veclen; i++)
      {   temp = XVECEXP(exp, 0, i);
          eval_rtx(temp);
        }
      break;
    default: break;
  }
}
```

Sample Demo Program
