

# GIZA++ and Moses

# Outline

---

- ▶ **GIZA++**
  - ▶ Steps
  - ▶ Output files
- ▶ **Moses**
  - ▶ Training pipeline
  - ▶ Decoder
- ▶ **Demo**

# GIZA++

---

- ▶ A statistical machine translation toolkit used to train IBM Models 1-5 (moses only uses output of IBM Model-1)
- ▶ Step-1: plain2snt.out - convert corpus to GIZA++ format
  - ▶ Generates vcb files and snt files
- ▶ Step-2: snt2cooc.out - generates the concurrence file
- ▶ Step-3: GIZA++ - generates alignment files

# Output Files

(1 / 3)

---

- ▶ Translation table (\*.t\*.\*)

- ▶ s\_id t\_id  $P(t\_id|s\_id)$

- ▶ Fertility table (\*.n3.\*)

- ▶ s\_id p0 p1 p2 ... pn

- ▶ where p0 is the probability that the source token has zero fertility; p1, fertility one, .....

- ▶ Probability of inserting a null after a source word (\*.p0\* )

- ▶ **Alignment tables ( \*.a\*.\* )**

- ▶ *Format:  $i \ j \ l \ m \ P(i | j, l, m)$*

- ▶ Where,

- $j$  = position in target sentence

- $i$  = position in source sentence

- $l$  = length of source sentence     $m$  = length of target sentence

- $P(i | j, l, m)$  is the probability that a source word in position  $i$  is moved to position  $j$  in a pair of sentences of length  $l$  and  $m$

- ▶ **Distortion table( \*.d3.\* )**

- ▶ The format is similar to the alignment tables but the position of  $i$  and  $j$  are switched:

$$j \ i \ l \ m \ P(j \mid i, l, m)$$

- ▶ **Alignment probability table for HMM alignment mode (\*.A3.\* )**

- ▶ **Perplexity File ( \*.perp )**

- ▶ **Revised vocabulary files (\*.src.vcb, \*.trg.vcb)**

- ▶ **Final parameter file: ( \*.gizacfg )**

# Moses

---

- ▶ An SMT system that allows you to automatically train translation models for any language pair
- ▶ Requires a parallel corpus
- ▶ An efficient search algorithm: finds the highest probability translation among the exponential number of choices
- ▶ Main components
  - ▶ Training Pipeline (mainly in perl)
  - ▶ Decoder (C++)

# Training Pipeline

---

- ▶ **Preprocessing**
  - ▶ Corpora cleaning
  - ▶ Tokenization
  - ▶ Case conversion
- ▶ **Word alignments (Using GIZA++)**
- ▶ **Language model building (Using SRILM)**

# Decoder

---

- ▶ Find the highest scoring sentence in the target language according to the translation model
  - ▶ **Four modules:**
    - ▶ **Input:** a plain sentence/annotated with xml-like elements /complex structure like a lattice or confusion network
    - ▶ **Translation model:** phrase-phrase rules/hierarchical rules. Also supports **features** to add extra information to the translation process
    - ▶ **Decoding algorithm:** several different strategies for the search, such as stack-based, cube-pruning, chart parsing etc.
    - ▶ **Language model:** supports several different language model toolkits (SRILM, KenLM, IRSTLM, RandLM)
- 

# Step-1: Preparing Training Data

---

- ▶ **Training data**
  - ▶ sentence aligned data (one sentence per line) in two files
- ▶ **Cleaning the corpus**
  - ▶ removes empty lines, redundant space characters
  - ▶ drops lines (and their corresponding lines), that are empty, too short, too long

## Step-2 : Run GIZA++ for Word Alignments

---

- ▶ Step-1: plain2snt.out - convert corpus to GIZA++ format
  - ▶ Generates vcb files and snt files
- ▶ Step-2: snt2cooc.out - generates the concurrence file
- ▶ Step-3: GIZA++ - generates alignment files (moses uses only IBM Model-1 output)

## Step-3: Align Words in sentences

---

- ▶ Different heuristics
- ▶ Default: grow-diag-final

	राम	ने	चम्मच	से	चावल	खाए
Ram	■	■				
ate						■
rice					■	
with			■	■	■	
a			■	■	■	
spoon			■	■	■	

A 6x6 grid illustrating word alignment between the Hindi sentence "राम ने चम्मच से चावल खाए" and the English sentence "Ram ate rice with a spoon". The grid cells are colored as follows: black for exact matches (Ram, ate, rice, with, a, spoon), dark green for partial matches (चम्मच, से, चावल), and light green for other cells. A dashed blue line is at the bottom of the slide.

## Step-4: Get Lexical Translation Table

---

- ▶ Estimates a maximum likelihood lexical translation table from the alignments (in both the directions)

e\_word f\_word p(e\_word | f\_word)

## Step-5: Extract Phrases

wiederaufnahme ||| resumption ||| 0-0

wiederaufnahme der ||| resumption of the ||| 0-0 1-1 1-2

wiederaufnahme der sitzungsperiode ||| resumption of the session ||| 0-0 1-1 1-2 2-3

der ||| of the ||| 0-0 0-1

der sitzungsperiode ||| of the session ||| 0-0 0-1 1-2

# Step-6: Score Phrases

---

## ► Format

phrase\_f ||| phrase\_e ||| a ||| b ||| c ||| d ||| e

Where,

a = Inverse phrase translation probability

b = Inverse lexical weighting

c = Direct phrase translation probability

d = Direct lexical weighting

e = phrase penalty

## Step-7: Reordering Model

---

## Step-8: Create configuration file

- ▶ Configuration file for the decoder (moses.ini)

# Tuning

---

- ▶ Decoding uses different features in a linear model
  - ▶ probabilities from the language models
  - ▶ phrase/rule tables
  - ▶ reordering models,
- ▶ **Tuning:** the process of finding the optimal weights for this linear model
- ▶ Optimal weights are those which maximise translation performance on the tuning dataset

# Other Functionalities

---

- ▶ Output a ranked list of the translation candidates
- ▶ Various types of information about how it came to its decision
- ▶ Binarisation of translation model for faster loading
- ▶ Evaluation of translations
- ▶ Alternative phrase scoring methods
- ▶ **Moses server:** provides an xml-rpc interface to the decoder
- ▶ **Web translation:** a set of scripts to be used to translate web pages
- ▶ **Analysis tools:** scripts to analyse and visualise Moses output, in comparison with a reference
