CS 747, Autumn 2023: Lecture 17

Shivaram Kalyanakrishnan

Department of Computer Science and Engineering Indian Institute of Technology Bombay

Autumn 2023

Reinforcement Learning

- 1. Generalisation and function approximation
- 2. Linear function approximation
- **3**. Linear $TD(\lambda)$

- Decision-making restricted to offense player with ball.
- Based on state, choose among DRIBBLE, PASS, SHOOT.

- Decision-making restricted to offense player with ball.
- Based on state, choose among DRIBBLE, PASS, SHOOT.
- How many states are there?

- Decision-making restricted to offense player with ball.
- Based on state, choose among DRIBBLE, PASS, SHOOT.
- How many states are there? An infinite number!

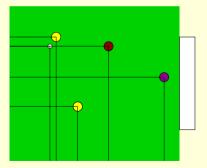

- Decision-making restricted to offense player with ball.
- Based on state, choose among DRIBBLE, PASS, SHOOT.
- How many states are there? An infinite number!
- What to do?

Shivaram Kalyanakrishnan (2023)

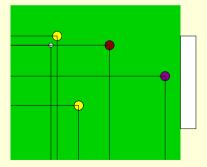

Features

• State s is defined by positions and velocities of players, ball.

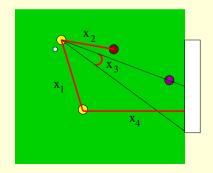

Features

- State s is defined by positions and velocities of players, ball.
- Velocities might not be important for decision making.
- Position coordinates might not generalise well.

Features

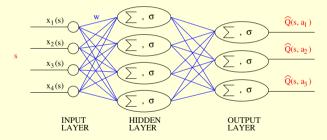

- State *s* is defined by positions and velocities of players, ball.
- Velocities might not be important for decision making.
- Position coordinates might not generalise well.
- Define features x : S → ℝ. Idea is that states with similar features will have similar consequences of actions, values.

- $x_1(s)$: Distance to teammate.
- *x*₂(*s*): Distance to nearest opponent.
- x₃(s): Largest open angle to goal.
- *x*₄(*s*): Distance of teammate to goal.

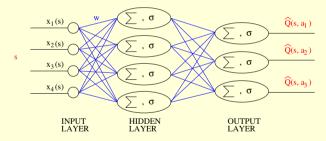

Compact Representation of \hat{Q}

- Illustration of Q approximated using a neural network.
- Input: (features of) state. One output for each action.
- Similar states will have similar Q-values.
- Can we learn weights w so that $\hat{Q}(s, a) \approx Q^{\star}(s, a)$?

Compact Representation of \hat{Q}

- Illustration of \hat{Q} approximated using a neural network.
- Input: (features of) state. One output for each action.
- Similar states will have similar Q-values.
- Can we learn weights w so that $\hat{Q}(s, a) \approx Q^{\star}(s, a)$?

- Might not be able to represent Q*!
- Unlike supervised learning, convergence not obvious!
- Even if convergent, might induce sub-optimal behaviour!

Shivaram Kalyanakrishnan (2023)

Reinforcement Learning

- 1. Generalisation and function approximation
- 2. Linear function approximation
- **3**. Linear $TD(\lambda)$

Prediction with a Linear Architecture

- Suppose we are to evaluate π on MDP (S, A, T, R, γ).
- Say we choose to approximate V^{π} by \hat{V} : for $s \in S$,

 $\hat{V}(w, s) = w \cdot x(s)$, where

 $x : S \to \mathbb{R}^d$ is a *d*-dimensional feature vector, and $w \in \mathbb{R}^d$ is the weight/coefficient vector.

Prediction with a Linear Architecture

- Suppose we are to evaluate π on MDP (S, A, T, R, γ).
- Say we choose to approximate V^{π} by \hat{V} : for $s \in S$,

 $\hat{V}(w, s) = w \cdot x(s)$, where

- $x : S \to \mathbb{R}^d$ is a *d*-dimensional feature vector, and $w \in \mathbb{R}^d$ is the weight/coefficient vector.
- Usually $d \ll |S|$.
- Illustration with |S| = 3, d = 2. Take $w = (w_1, w_2)$.

$$\begin{array}{|c|c|c|c|c|c|c|c|} \hline s & V^{\pi}(s) & x_1(s) & x_2(s) & \hat{V}(w,s) \\ \hline s_1 & 7 & 2 & -1 & 2w_1 - w_2 \\ \hline s_2 & 2 & 4 & 0 & 4w_1 \\ \hline s_3 & -4 & 2 & 3 & 2w_1 + 3w_2 \\ \hline \end{array}$$

The Best Approximation

- Observe that for all $w \in \mathbb{R}^2$, $\hat{V}(w, s_2) = \frac{3\hat{V}(w, s_1) + \hat{V}(w, s_3)}{2}$.
- In general, \hat{V} cannot be made equal to V^{π} .

The Best Approximation

$$\begin{array}{c|ccccc} s & V^{\pi}(s) & x_1(s) & x_2(s) & \hat{V}(w,s) \\ \hline s_1 & 7 & 2 & -1 & 2w_1 - w_2 \\ s_2 & 2 & 4 & 0 & 4w_1 \\ s_3 & -4 & 2 & 3 & 2w_1 + 3w_2 \end{array}$$

- Observe that for all $w \in \mathbb{R}^2$, $\hat{V}(w, s_2) = rac{3\hat{V}(w, s_1) + \hat{V}(w, s_3)}{2}$
- In general, \hat{V} cannot be made equal to V^{π} .
- Which w provides the best approximation?

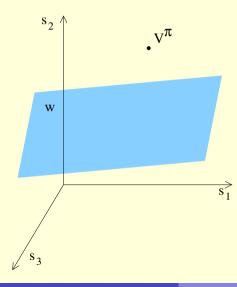

The Best Approximation

- Observe that for all $w \in \mathbb{R}^2$, $\hat{V}(w, s_2) = rac{3\hat{V}(w, s_1) + \hat{V}(w, s_3)}{2}$
- In general, \hat{V} cannot be made equal to V^{π} .
- Which w provides the best approximation?
- A common choice is

$$egin{aligned} & m{w}^{\star} = \operatorname*{argmin}_{m{w} \in \mathbb{R}^d} MSVE(m{w}), \ & m{MSVE}(m{w}) \stackrel{ ext{def}}{=} rac{1}{2} \sum_{m{s} \in S} \mu^{\pi}(m{s}) \{ V^{\pi}(m{s}) - \hat{V}(m{w},m{s}) \}^2, \end{aligned}$$

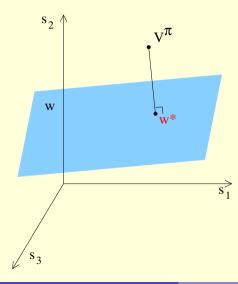

where μ^{π} : $S \rightarrow [0, 1]$ is the stationary distribution of π .

Geometric View

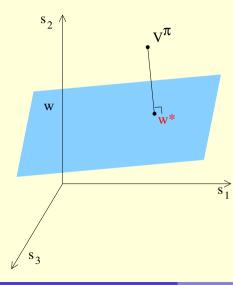

(μ^{π} -scaling not explicitly shown.)

Geometric View

(μ^{π} -scaling not explicitly shown.)

Geometric View

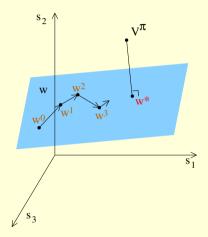

(μ^{π} -scaling not explicitly shown.)

How to find *w**?

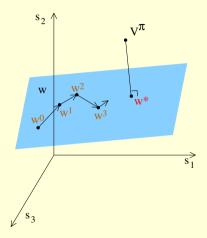

Reinforcement Learning

- 1. Generalisation and function approximation
- 2. Linear function approximation
- **3.** Linear $TD(\lambda)$

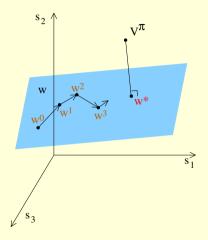

• Iteratively take steps in the w space in the direction minimising MSVE(w).

• Iteratively take steps in the w space in the direction minimising MSVE(w).

• Iteratively take steps in the w space in the direction minimising MSVE(w).

• Initialise $w^0 \in \mathbb{R}^d$ arbitrarily. For $t \ge 0$ update as

$$\begin{split} \mathbf{w}^{t+1} \leftarrow \mathbf{w}^t - \alpha_{t+1} \nabla_{\mathbf{w}} \left(\frac{1}{2} \sum_{s \in S} \mu^{\pi}(s) \{ \mathbf{V}^{\pi}(s) - \hat{\mathbf{V}}(\mathbf{w}^t, s) \}^2 \right) \\ &= \mathbf{w}^t + \alpha_{t+1} \sum_{s \in S} \mu^{\pi}(s) \{ \mathbf{V}^{\pi}(s) - \hat{\mathbf{V}}(\mathbf{w}^t, s) \} \nabla_{\mathbf{w}} \hat{\mathbf{V}}(\mathbf{w}^t, s). \end{split}$$

• Initialise $w^0 \in \mathbb{R}^d$ arbitrarily. For $t \ge 0$ update as

$$egin{aligned} & m{w}^{t+1} \leftarrow m{w}^t - lpha_{t+1}
abla_{m{w}} \left(rac{1}{2} \sum_{m{s} \in \mathcal{S}} \mu^\pi(m{s}) \{ m{V}^\pi(m{s}) - \hat{m{V}}(m{w}^t,m{s}) \}^2
ight) \ &= m{w}^t + lpha_{t+1} \sum_{m{s} \in \mathcal{S}} \mu^\pi(m{s}) \{ m{V}^\pi(m{s}) - \hat{m{V}}(m{w}^t,m{s}) \}
abla_{m{w}} \hat{m{V}}(m{w}^t,m{s}). \end{aligned}$$

• But we don't know $\mu^{\pi}(s)$, $V^{\pi}(s)$ for all $s \in S$. We're learning, remember?

• Initialise $w^0 \in \mathbb{R}^d$ arbitrarily. For $t \ge 0$ update as

$$egin{aligned} egin{aligned} egin{aligne} egin{aligned} egin{aligned} egin{aligned} egin$$

- But we don't know $\mu^{\pi}(s)$, $V^{\pi}(s)$ for all $s \in S$. We're learning, remember?
- Luckily, stochastic gradient descent allows us to update as

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^t + \alpha_{t+1} \{ \boldsymbol{V}^{\pi}(\boldsymbol{s}^t) - \hat{\boldsymbol{V}}(\boldsymbol{w}^t, \boldsymbol{s}^t) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^t, \boldsymbol{s}^t)$$

since $s^t \sim \mu^{\pi}$ anyway (as $t \to \infty$).

• Initialise $w^0 \in \mathbb{R}^d$ arbitrarily. For $t \ge 0$ update as

$$oldsymbol{w}^{t+1} \leftarrow oldsymbol{w}^t - lpha_{t+1}
abla_{oldsymbol{w}} \left(rac{1}{2} \sum_{oldsymbol{s} \in \mathcal{S}} \mu^{\pi}(oldsymbol{s}) \{ oldsymbol{V}^{\pi}(oldsymbol{s}) - \hat{oldsymbol{V}}(oldsymbol{w}^t, oldsymbol{s}) \}^2
ight)
onumber \ = oldsymbol{w}^t + lpha_{t+1} \sum_{oldsymbol{s} \in \mathcal{S}} \mu^{\pi}(oldsymbol{s}) \{ oldsymbol{V}^{\pi}(oldsymbol{s}) - \hat{oldsymbol{V}}(oldsymbol{w}^t, oldsymbol{s}) \}^2
ight)
onumber \ = oldsymbol{w}^t + lpha_{t+1} \sum_{oldsymbol{s} \in \mathcal{S}} \mu^{\pi}(oldsymbol{s}) \{ oldsymbol{V}^{\pi}(oldsymbol{s}) - \hat{oldsymbol{V}}(oldsymbol{w}^t, oldsymbol{s}) \}
abla_{oldsymbol{w}} \hat{oldsymbol{V}}(oldsymbol{w}^t, oldsymbol{s}) \}
abla_{oldsymbol{w}} \hat{oldsymbol{V}}(oldsymbol{w}^t, oldsymbol{s}) \}
abla_{oldsymbol{v}} \hat{oldsymbol{V}}(oldsymbol{w}^t, oldsymbol{s}) \}$$

- But we don't know $\mu^{\pi}(s)$, $V^{\pi}(s)$ for all $s \in S$. We're learning, remember?
- Luckily, stochastic gradient descent allows us to update as

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^t + \alpha_{t+1} \{ \boldsymbol{V}^{\pi}(\boldsymbol{s}^t) - \hat{\boldsymbol{V}}(\boldsymbol{w}^t, \boldsymbol{s}^t) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^t, \boldsymbol{s}^t)$$

since $\mathbf{s}^t \sim \mu^{\pi}$ anyway (as $t \to \infty$).

• But still, we don't know $V^{\pi}(s^t)$! What to do?

• Although we cannot perform update

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^{t} + \alpha_{t+1} \{ \boldsymbol{V}^{\pi}(\boldsymbol{s}^{t}) - \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}),$$

we can do

$$\mathbf{w}^{t+1} \leftarrow \mathbf{w}^t + \alpha_{t+1} \{ \mathbf{G}_{t:\infty} - \hat{\mathbf{V}}(\mathbf{w}^t, \mathbf{s}^t) \} \nabla_{\mathbf{w}} \hat{\mathbf{V}}(\mathbf{w}^t, \mathbf{s}^t),$$

since $\mathbb{E}[\mathbf{G}_{t:\infty}] = \mathbf{V}^{\pi}(\mathbf{s}^t).$

• Although we cannot perform update

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^{t} + \alpha_{t+1} \{ \boldsymbol{V}^{\pi}(\boldsymbol{s}^{t}) - \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}),$$

we can do

$$w^{t+1} \leftarrow w^t + \alpha_{t+1} \{ G_{t:\infty} - \hat{V}(w^t, s^t) \} \nabla_w \hat{V}(w^t, s^t),$$

since $\mathbb{E}[G_{t:\infty}] = V^{\pi}(s^t).$

In practice, we also do

$$\mathbf{w}^{t+1} \leftarrow \mathbf{w}^t + \alpha_{t+1} \{ \mathbf{G}_t^{\lambda} - \hat{\mathbf{V}}(\mathbf{w}^t, \mathbf{s}^t) \} \nabla_{\mathbf{w}} \hat{\mathbf{V}}(\mathbf{w}^t, \mathbf{s}^t),$$

for $\lambda < 1$, even if $\mathbb{E}[G_t^{\lambda}] \neq V^{\pi}(s^t)$ in general.

• Although we cannot perform update

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^{t} + \alpha_{t+1} \{ \boldsymbol{V}^{\pi}(\boldsymbol{s}^{t}) - \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}),$$

we can do

$$\mathbf{w}^{t+1} \leftarrow \mathbf{w}^t + \alpha_{t+1} \{ \mathbf{G}_{t:\infty} - \hat{\mathbf{V}}(\mathbf{w}^t, \mathbf{s}^t) \} \nabla_{\mathbf{w}} \hat{\mathbf{V}}(\mathbf{w}^t, \mathbf{s}^t),$$

since $\mathbb{E}[\mathbf{G}_{t:\infty}] = \mathbf{V}^{\pi}(\mathbf{s}^t).$

In practice, we also do

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^{t} + \alpha_{t+1} \{ \boldsymbol{G}_{t}^{\lambda} - \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}),$$

for $\lambda < 1$, even if $\mathbb{E}[G_t^{\lambda}] \neq V^{\pi}(s^t)$ in general. For example, Linear TD(0) performs the update

$$\mathbf{w}^{t+1} \leftarrow \mathbf{w}^t + \alpha_{t+1} \{ \mathbf{r}^t + \gamma \mathbf{w}^t \cdot \mathbf{x}(\mathbf{s}^{t+1}) - \mathbf{w}^t \cdot \mathbf{x}(\mathbf{s}^t) \} \mathbf{x}(\mathbf{s}^t).$$

• Although we cannot perform update

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^{t} + \alpha_{t+1} \{ \boldsymbol{V}^{\pi}(\boldsymbol{s}^{t}) - \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}),$$

we can do

$$w^{t+1} \leftarrow w^t + \alpha_{t+1} \{ \mathbf{G}_{t:\infty} - \hat{V}(w^t, s^t) \} \nabla_w \hat{V}(w^t, s^t),$$

since $\mathbb{E}[\mathbf{G}_{t:\infty}] = V^{\pi}(s^t).$

In practice, we also do

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^{t} + \alpha_{t+1} \{ \boldsymbol{G}_{t}^{\lambda} - \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}) \} \nabla_{\boldsymbol{w}} \hat{\boldsymbol{V}}(\boldsymbol{w}^{t}, \boldsymbol{s}^{t}),$$

for $\lambda < 1$, even if $\mathbb{E}[G_t^{\lambda}] \neq V^{\pi}(s^t)$ in general. For example, Linear TD(0) performs the update

$$\boldsymbol{w}^{t+1} \leftarrow \boldsymbol{w}^t + \alpha_{t+1} \{ \boldsymbol{r}^t + \gamma \boldsymbol{w}^t \cdot \boldsymbol{x}(\boldsymbol{s}^{t+1}) - \boldsymbol{w}^t \cdot \boldsymbol{x}(\boldsymbol{s}^t) \} \boldsymbol{x}(\boldsymbol{s}^t).$$

 For λ < 1, the process is not true gradient descent. But it still converges with linear function approximation.

Shivaram Kalyanakrishnan (2023)

Linear $TD(\lambda)$ algorithm

- Maintains an eligibility trace $z \in \mathbb{R}^d$.
- Recall that $\hat{V}(w, s) = w \cdot x(s)$, hence $\nabla_w \hat{V}(w, s) = x(s)$.

Linear $TD(\lambda)$ algorithm

- Maintains an eligibility trace $z \in \mathbb{R}^d$.
- Recall that $\hat{V}(w, s) = w \cdot x(s)$, hence $\nabla_w \hat{V}(w, s) = x(s)$.

```
Initialise w \in \mathbb{R}^d arbitrarily.
Repeat for each episode:
         Set z \rightarrow 0.//Eligibility trace vector.
         Assume the agent is born in state s.
         Repeat for each step of episode:
                  Take action a; obtain reward r, next state s'.
                  \delta \leftarrow \mathbf{r} + \gamma \hat{\mathbf{V}}(\mathbf{w}, \mathbf{s}') - \hat{\mathbf{V}}(\mathbf{w}, \mathbf{s}).
                  z \leftarrow \gamma \lambda z + \nabla_{w} \hat{V}(w, s).
                   \mathbf{W} \leftarrow \mathbf{W} + \alpha \delta \mathbf{Z}.
                  \boldsymbol{s} \leftarrow \boldsymbol{s}'.
```

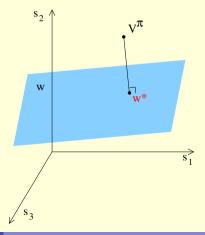

Linear TD(λ) algorithm

                  Take action a; obtain reward r, next state s'.
                 \delta \leftarrow \mathbf{r} + \gamma \hat{\mathbf{V}}(\mathbf{w}, \mathbf{s}') - \hat{\mathbf{V}}(\mathbf{w}, \mathbf{s}).
                 z \leftarrow \gamma \lambda z + \nabla_{w} \hat{V}(w, s).
                  \mathbf{W} \leftarrow \mathbf{W} + \alpha \delta \mathbf{Z}.
                  s \leftarrow s'
```

 See Sutton and Barto (2018) for variations (accumulating, replacing, and dutch traces). Convergence of Linear $TD(\lambda)$

$$\textit{MSVE}(\textit{w}^{\infty}_{\lambda}) \leq rac{1-\gamma\lambda}{1-\gamma}\textit{MSVE}(\textit{w}^{\star}).$$

Convergence of Linear $TD(\lambda)$

$$MSVE(w_{\lambda}^{\infty}) \leq rac{1-\gamma\lambda}{1-\gamma}MSVE(w^{\star}).$$

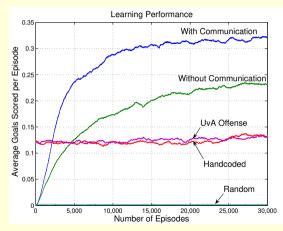

Shivaram Kalyanakrishnan (2023)

Control with Linear Function Approximation

- Linear function approximation is implemented in the control by approximating $Q(s, a) \approx w \cdot x(s, a)$.
- Linear Sarsa(λ) is a very popular algorithm.

RL on Half Field Offense

• Uses Linear Sarsa(0) with tile coding.
