Part 1

GCC Code Organization

30 June 2011	Config and Build: GCC Code Organization	2/53	30 June 2011	Config and Build: GCC Code Organization	2/53
	GCC Code Organization			GCC Code Organization	
Logical parts a	are:				
• Build confi	guration files				
• Front end -	+ generic + generator sources		S		
 Back end s 	pecifications		O		
 Emulation 	libraries		i o		
(eg. libgc	cc to emulate operations not supported on the target))	2		
• Language L	Libraries (except C)				
• Support so	ftware (e.g. garbage collector)				

30 June 2011

Config and Build: GCC Code Organization

GCC Code Organization

Notes

Config and Build: GCC Code Organization

4/53

GCC Code Organization

Front End Code

- Source language dir: \$(SOURCE_D)/gcc/<lang dir>
- Source language dir contains
 - Parsing code (Hand written)
 - Additional AST/Generic nodes, if any
 - Interface to Generic creation

Except for C – which is the "native" language of the compiler

C front end code in: $(SOURCE_D)/gcc$

Optimizer Code and Back End Generator Code

• Source language dir: \$(SOURCE_D)/gcc

Essential Abstractions in GCC	GCC Resource Center, IIT Bomb

30 June 2011

Config and Build: GCC Code Organization
Back End Specification

- \$(SOURCE_D)/gcc/config/<target dir>/ Directory containing back end code
- Two main files: <target>.h and <target>.md, e.g. for an i386 target, we have \$(SOURCE_D)/gcc/config/i386/i386.md and \$(SOURCE_D)/gcc/config/i386/i386.h
- Usually, also <target>.c for additional processing code (e.g. \$(SOURCE_D)/gcc/config/i386/i386.c)
- Some additional files

Part 2

Configuration and Building: Basic Concepts

Notes

		· · ·			
30 June 2011 Config and Build: Configuration and Building: Basic Concepts					

Preparing the GCC source for local adaptation:

- The platform on which it will be compiled
- The platform on which the generated compiler will execute
- The platform for which the generated compiler will generate code
- The directory in which the source exists
- The directory in which the compiler will be generated
- The directory in which the generated compiler will be installed
- The input languages which will be supported
- The libraries that are required
- etc.

Config and Build: Configuration and Building: Basic Concepts
Configuration

5/53

Notes

30 June 2011

Pre-requisites for Configuring and Building GCC 4.6.0

- ISO C90 Compiler / GCC 2.95 or later
- GNU bash: for running configure etc
- Awk: creating some of the generated source file for GCC
- bzip/gzip/untar etc. For unzipping the downloaded source file
- GNU make version 3.8 (or later)
- GNU Multiple Precision Library (GMP) version 4.3.2 (or later)
- mpfr Library version 3.0.0 (or later) (multiple precision floating point with correct rounding)
- mpc Library version 0.8.2 (or later)
- Parma Polyhedra Library (ppl) version 0.11
- CLooG-PPL (Chunky Loop Generator) version 0.15.11
- jar, or InfoZIP (zip and unzip)
- libelf version 0.8.12 (or later)

 Config and Build: Configuration and Building: Basic Concepts
 15/53

 Bootstrapping: The Conventional View

- Language need not change, but the compiler may change Compiler is improved, bugs are fixed and newer versions are released
- To build a new version of a compiler given a built old version:
 - ► Stage 1: Build the new compiler using the old compiler
 - \blacktriangleright Stage 2: Build another new compiler using compiler from stage 1
 - Stage 3: Build another new compiler using compiler from stage 2 Stage 2 and stage 3 builds must result in identical compilers
- \Rightarrow Building cross compilers stops after Stage 1!

Registering New Machine Descriptions

Config and Build: Registering New Machine Descriptions 30 June 2011 Config and Build: Registering New Machine Descriptions 33/53 30 June 2011 **Registering New Machine Descriptions Registering New Machine Descriptions** • Define a new system name, typically a triple. e.g. spim-gnu-linux • Edit \$(SOURCE_D)/config.sub to recognize the triple • Edit \$(SOURCE_D)/gcc/config.gcc to define Notes any back end specific variables ▶ any back end specific files \$(SOURCE_D)/gcc/config/<cpu> is used as the back end directory

for recognized system names.

Tip

Read comments in \$(SOURCE_D)/config.sub & \$(SOURCE_D)/gcc/config/<cpu>.

Notes

33/53

Registering Spim with GCC Build Process

34/53

34/53

Registering Spim with GCC Build Process

We want to add multiple descriptions:

• Step 1. In the file \$(SOURCE_D)/config.sub

```
Add to the case $basic_machine
```

- spim* in the part following
 # Recognize the basic CPU types without company name.
- spim*-* in the part following
- # Recognize the basic CPU types with company name.

Notes

• Step 2a. In the file \$(SOURCE_D)/gcc/config.gcc

In case \${target} used for defining cpu_type, i.e. after the line

Set default cpu_type, tm_file, tm_p_file and xm_file ...

add the following case

```
spim*-*-*)
    cpu_type=spim
;;
```

This says that the machine description files are available in the directory $(SOURCE_D)/gcc/config/spim.$

```

43/53

43/53

Building First GCC

• Change the working directory to gcc.

crossbuild\$. cd gcc

• Untar the gcc-4.6.0 source tarball here.

crossbuild/gcc\$. tar -xvf gcc-4.6.0.tar.gz

• Make a build directory to configure and build gcc, and go to that directory.

```
crossbuild/gcc$. mkdir build
crossbuild/gcc$. cd build
```

libgcc and other libraries are built using libc headers. Shared libraries like 'libgcc_s.so' are to be compiled against EGLIBC headers (not installed yet), and linked against 'libc.so' (not built yet). We need configure time options to tell GCC not to build 'libgcc_s.so'.

Essential Abstractions in GCC

GCC Resource Center, IIT Bombay

30 June 2011

Config and Build: Building A Cross Compiler
Building First GCC

Notes

Essential Abstractions in GCC

GCC Resource Center, IIT Bombay

30 June 2011

Config and Build: Building A Cross Compiler Building First GCC

• Configure gcc:

crossbuild/gcc/build\$. ../gcc-4.6.0/configure --target=\$target --prefix=\$prefix --without-headers --with-newlib --disable-shared --disable-threads --disable-libssp --disable-libgomp --disable-libmudflap --enable-languages=c

'--without-headers' \Rightarrow build libgcc without any headers at all. '--with-newlib' \Rightarrow use newlib header while building other libraries than libgcc.

Using both the options together results in libgcc being built without requiring the presence of any header, and other libraries being built with newlib headers.

• Configure eglibc:

crossbuild/eglibc/build\$. BUILD_CC=gcc CC=\$prefix/bin/\$target-gcc AR=\$prefix/bin/\$target-ar RANLIB=\$prefix/bin/\$target-ranlib ../eglibc/libc/configure --prefix=/usr --with-headers=\$sysroot/usr/include --build=\$build --host=\$target --disable-profile --without-gd --without-cvs --enable-add-ons

EGLIBC must be configured with option '--prefix=/usr', because the EGLIBC build system checks whether the prefix is '/usr', and does special handling only if that is the case.

30 June 2011	Config and Build: Building A Cross Compiler	
Installing EGL	_IBC Headers and Preliminary Objects	

• We can now use the 'install-headers' makefile target to install the headers:

crossbuild/eglibc/build\$. make install-headers install_root=\$sysroot install-bootstrap-headers=yes

'install-bootstrap-headers' variable requests special handling for certain tricky header files.

(autoconf 2.13 causes some problems. Get version 2.50 or later)

• There are a few object files that are needed to link shared libraries. We will build and install them by hand:

crossbuild/eglibc/build\$. mkdir -p \$sysroot/usr/lib crossbuild/eglibc/build\$. make csu/subdir_lib crossbuild/eglibc/build\$. cd csu crossbuild/eglibc/build/csu\$. cp crt1.0 crti.0 crtn.0 \$sysroot/usr/lib

Installing EGLIBC Headers and Preliminary Objects

• Finally, 'libgcc_s.so' requires a 'libc.so' to link against. However, since we will never actually execute its code, it doesn't matter what it contains. So, treating '/dev/null' as a C souce code, we produce a dummy 'libc.so' in one step:

crossbuild/eglibc/build/csu\$. \$prefix/bin/\$target-gcc -nostdlib -nostartfiles -shared -x c /dev/null -o \$sysroot/usr/lib/libc.so

• change the working directory back to crossbuild.

crossbuild/gcc/build\$. cd ~/crossbuild

Config and Build: Building A Cross Compiler

Building Complete EGLIBC

With the second compiler built and installed, build EGLIBC completely.

• Change the working directory to the build directory inside eglibc folder.

crossbuild\$. cd eglibc/build

• Clean the build folder.

crossbuild/eglibc/build\$. rm -rf *

• Configure eglibc:

crossbuild/eglibc/build\$. BUILD_CC=gcc CC=\$prefix/bin/\$target-gcc AR=\$prefix/bin/\$target-ar RANLIB=\$prefix/bin/\$target-ranlib ../eglibc/libc/configure --prefix=/usr --with-headers=\$sysroot/usr/include --build=\$build --host=\$target --disable-profile --without-gd --without-cvs --enable-add-ons

Config and Build: Building A Cross Compiler 47/53
Building Complete EGLIBC

• install the required libraries in \$sysroot:

crossbuild/eglibc/build\$. PATH=\$prefix/bin:\$PATH make crossbuild/eglibc/build\$. PATH=\$prefix/bin:\$PATH make install install_root=\$sysroot

• change the working directory back to crossbuild.

crossbuild/gcc/build\$. cd ~/crossbuild

At this point, we have a complete EGLIBC installation in '\$sysroot', with header files, library files, and most of the C runtime startup files in place.

Config and Build: Building A Cross Compiler

Maintaining \$sysroot Folder

Since GCC's installation process is not designed to help construct sysroot trees, certain libraries must be manually copied into place in the sysroot.

• Copy the libgcc_s.so files to the lib folder in \$sysroot.

crossbuild\$.cp -d \$prefix/\$target/lib/libgcc_s.so*
\$sysroot/lib

• If c++ language was enabled, copy the libstdc++.so files to the usr/lib folder in \$sysroot.

crossbuild\$.cp -d \$prefix/\$target/lib/libstdc++.so*
\$sysroot/usr/lib

At this point, we have a ready cross compile toolchain in \$prefix, and EGLIBC installation in \$sysroot.
