1/81

The Scope of This Tutorial

- · What this tutorial does not address
 - ► Details of algorithms, code and data structures used for parallelization and vectorization
 - ▶ Machine level issues related to parallelization and vectorization
- What this tutorial addresses
 - ▶ GCC's approach of discovering and exploiting parallelism
 - Illustrated using carefully chosen examples

Part 1

Transformations for Parallel and Vector Execution

Vectorization: SISD ⇒ SIMD

(8-bit, 16-bit, 32-bit operands)Existing 32 or 64-bit arithmetic units used to perform multiple

Parallelism in executing operation on shorter operands

• Existing 32 or 64-bit arithmetic units used to perform multiple operations in parallel A 64 bit word \equiv a vector of 2×(32 bits), 4×(16 bits), or 8×(8 bits)

This case is not possible

3 July 2012

Vectorization $(SISD \Rightarrow SIMD)$: No $(SISD \Rightarrow MIMD)$: Yes Parallelization

- This case is not possible
- Vectorization is a limited granularity parallelization

3 July 2012

Example 4

Vectorization (SISD \Rightarrow SIMD) : No Parallelization (SISD \Rightarrow MIMD) : Yes

- This case is not possible
- Vectorization is a limited granularity parallelization
- If parallelization is possible then vectorization is trivially possible

Data Dependence

Let statements S_i and S_j access memory location m at time instants t and t+k

riceess iii ej	Bependence	rtotation
Write m	Anti (or Pseudo)	$S_i \ \bar{\delta} \ S_j$
Read m	Flow (or True)	$S_i \delta S_j$
Write m	Output (or Pseudo)	$S_i \delta^o S_j$
Read <i>m</i>	Does not matter	
	Read <i>m</i> Write <i>m</i>	Write m Anti (or Pseudo) Read m Flow (or True) Write m Output (or Pseudo)

- Pseudo dependences may be eliminated by some transformations
- True dependence cannot be eliminated

Access in S_i | Access in S_i | Dependence

Notation

Data Dependence

Consider dependence between statements S_i and S_j in a loop

- Loop independent dependence. t and t + k occur in the same iteration of a loop
 - \triangleright S_i and S_j must be executed sequentially
 - ▶ Different iterations of the loop can be parallelized
- Loop carried dependence. t and t+k occur in the different iterations of a loop
 - ▶ Within an iteration, S_i and S_j can be executed in parallel
 - ▶ Different iterations of the loop must be executed sequentially
- S_i and S_j may have both loop carried and loop independent dependences

Program

Dependence graph

No loop carried dependence
 Both vectorization and parallelization are possible

Program

• Dependence graph

Dependence in the same iteration

No loop carried dependence
 Both vectorization and parallelization are possible

Program

Dependence graph

Loop carried anti-dependence
 Parallelization is not possible
 Vectorization is possible since all reads are done before all writes

Program

Dependence graph

Dependence due to the outermost loop

Loop carried anti-dependence
 Parallelization is not possible
 Vectorization is possible since all reads are done before all writes

Program

Dependence graph

Loop carried flow-dependence
 Neither parallelization not vectorization is possible

Data Dependence Theorem

There exists a dependence from statement S_1 to statement S_2 in common nest of loops if and only if there exist two iteration vectors \mathbf{i} and \mathbf{j} for the nest, such that

- 1. $\mathbf{i} < \mathbf{j}$ or $\mathbf{i} = \mathbf{j}$ and there exists a path from S_1 to S_2 in the body of the loop,
- 2. statement S_1 accesses memory location M on iteration \mathbf{i} and statement S_2 accesses location M on iteration \mathbf{i} , and
- 3. one of these accesses is a write access.

for (i=0; i<N; i++) {
    S<sub>1</sub>: B[i] = A[i+1];
    S<sub>2</sub>: A[i] = B[i+5];
}
```

- Rescheduling of statements will not break the cyclic dependence
- The dependence distance from S_2 to $S_1 \geq VF$

```
int A[N], B[N], i;
for (i=0; i<N; i++) {
    S<sub>1</sub>: B[i+2] = A[i];
    S<sub>2</sub>: A[i+5] = B[i];
}
```

Cyclic True Dependence

```
Cyclic Anti Dependence

int A[N], B[N], i;
for (i=0; i<N; i++) {
    S_1: B[i] = A[i+1];
    S_2: A[i] = B[i+5];
}</pre>
```

- Rescheduling of statements will not break the cyclic dependence
- The dependence distance from S_2 to $S_1 \geq VF$

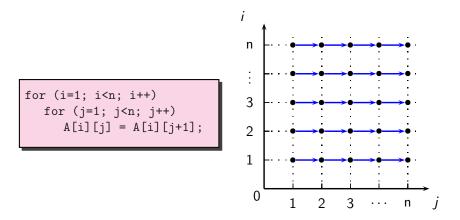

Can Vectorize

Observation: Feasibility of Vectorization

- If the source statement lexicographically precedes sink statement in the program, they can be vectorized.
- If the dependence distance for all *backward* dependences between two statements is greater than or equal to Vectorization Factor, the statements can be vectorized.

Loop Transformation Passes in GCC: Our Focus

Dass variable name

Data Dependence	Pass variable name	pass_check_data_deps
	Enabling switch	-fcheck-data-deps
	Dump switch	-fdump-tree-ckdd
	Dump file extension	.ckdd
Loop Distribution	Pass variable name	pass_loop_distribution
	Enabling switch	-ftree-loop-distribution
	Dump switch	-fdump-tree-ldist
	Dump file extension	.ldist
Vectorization	Pass variable name	pass_vectorize
	Enabling switch	-ftree-vectorize
	Dump switch	-fdump-tree-vect
	Dump file extension	.vect
Parallelization	Pass variable name	pass_parallelize_loops
	Enabling switch	-ftree-parallelize-loops=n
	Dump switch	-fdump-tree-parloops
	Dump file extension	.parloops

Compiling for Emitting Dumps

- Other necessary command line switches
 - -02 -fdump-tree-all
 -03 enables -ftree-vectorize. Other flags must be enabled explicitly
- Processor related switches to enable transformations apart from analysis
 - ► -mtune=pentium -msse4
- Other useful options
 - ► Suffixing -all to all dump switches
 - ► -S to stop the compilation with assembly generation
 - ▶ --verbose-asm to see more detailed assembly dump

gcc-par-vect: The Lambda Framework

Step 4: Understanding the strategy of parallel execution • Create threads t_i for $1 \le i \le MAX_THREADS$

GCC Resource Center, IIT Bomba

Step 4: Understanding the strategy of parallel execution

gcc-par-vect: The Lambda Framework

- Create threads t_i for $1 \le i \le MAX_THREADS$
- Assigning start and end iteration for each thread
- ⇒ Distribute iteration space across all threads

Step 4: Understanding the strategy of parallel execution

- Create threads t_i for $1 \le i \le MAX_THREADS$
- Assigning start and end iteration for each thread
 - \Rightarrow Distribute iteration space across all threads
- Create the following code body for each thread t_i

```
for (j=start_for_thread_i; j<=end_for_thread_i; j++)
{
    /* execute the loop body to be parallelized */
}</pre>
```

Step 4: Understanding the strategy of parallel execution

- Create threads t_i for $1 \le i \le MAX_THREADS$
- Assigning start and end iteration for each thread
 - \Rightarrow Distribute iteration space across all threads
- Create the following code body for each thread t_i

```
for (j=start_for_thread_i; j<=end_for_thread_i; j++)
{
    /* execute the loop body to be parallelized */
}</pre>
```

All threads are executed in parallel

Step 5: Examining the thread creation in parallelized control flow graph

```
D.1996_6 = __builtin_omp_get_num_threads ();
D.1998_8 = __builtin_omp_get_thread_num ();
D.2000_10 = 255 / D.1997_6;
D.2001_11 = D.2000_10 * D.1997_6;
D.2002_12 = D.2001_11 != 255;
D.2003_13 = D.2002_12 + D.2000_10;
ivtmp.7_14 = D.2003_13 * D.1999_8;
D.2005_15 = ivtmp.7_14 + D.2003_13;
D.2006_16 = MIN_EXPR <D.2005_15, 255>;
if (ivtmp.7_14 >= D.2006_16)
goto <br/>
goto <br/>
```

Step 5: Examining the thread creation in parallelized control flow graph

```
D.1996_6 = _builtin_omp_get_num_threads ();
D.1998_8 = _builtin_omp_get_thread_num ();
D.2000_{10} = 255 / D.1997_{6};
D.2001_{11} = D.2000_{10} * D.1997_{6};
D.2002_{12} = D.2001_{11} != 255:
D.2003_{13} = D.2002_{12} + D.2000_{10};
ivtmp.7_14 = D.2003_13 * D.1999_8;
D.2005_{15} = ivtmp.7_{14} + D.2003_{13};
D.2006_16 = MIN_EXPR < D.2005_15, 255>;
if (ivtmp.7_14 >= D.2006_16)
  goto <bb 3>;
```

Get the number of threads

Step 5: Examining the thread creation in parallelized control flow graph

```
D.1996_6 = __builtin_omp_get_num_threads ();
D.1998_8 = _builtin_omp_get_thread_num ();
D.2000_{10} = 255 / D.1997_{6};
D.2001_{11} = D.2000_{10} * D.1997_{6};
D.2002_{12} = D.2001_{11} != 255;
D.2003_{13} = D.2002_{12} + D.2000_{10};
ivtmp.7_14 = D.2003_13 * D.1999_8;
D.2005_{15} = ivtmp.7_{14} + D.2003_{13};
D.2006_16 = MIN_EXPR < D.2005_15, 255>;
if (ivtmp.7_14 >= D.2006_16)
  goto <bb 3>;
```

Get thread identity

Step 5: Examining the thread creation in parallelized control flow graph

```
D.1996_6 = _builtin_omp_get_num_threads ();
D.1998_8 = _builtin_omp_get_thread_num ();
D.2000_{10} = 255 / D.1997_{6};
D.2001_{11} = D.2000_{10} * D.1997_{6}:
D.2002_{12} = D.2001_{11} != 255:
D.2003_{13} = D.2002_{12} + D.2000_{10};
ivtmp.7_14 = D.2003_13 * D.1999_8;
D.2005_{15} = ivtmp.7_{14} + D.2003_{13};
D.2006_16 = MIN_EXPR < D.2005_15, 255>;
if (ivtmp.7_14 >= D.2006_16)
  goto <bb 3>;
```

Perform load calculations

gcc-par-vect: The Lambda Framework

Example 2: Observing Vectorization and Parallelization

Step 5: Examining the thread creation in parallelized control flow graph

```
D.1996_6 = __builtin_omp_get_num_threads ();
D.1998_8 = _builtin_omp_get_thread_num ();
D.2000_{10} = 255 / D.1997_{6};
D.2001_{11} = D.2000_{10} * D.1997_{6};
D.2002_{12} = D.2001_{11} != 255;
D.2003_{13} = D.2002_{12} + D.2000_{10};
ivtmp.7_14 = D.2003_13 * D.1999_8;
D.2005_{15} = ivtmp.7_{14} + D.2003_{13};
D.2006_16 = MIN_EXPR < D.2005_15, 255>;
if (ivtmp.7_14 >= D.2006_16)
  goto <bb 3>;
```

Assign start iteration to the chosen thread

Step 5: Examining the thread creation in parallelized control flow graph

```
D.1996_6 = __builtin_omp_get_num_threads ();
D.1998_8 = _builtin_omp_get_thread_num ();
D.2000_{10} = 255 / D.1997_{6};

Part 3

Transformations Enhancing Vectorization and Parallelization

Transformations Enhancing Vectorization and Parallelization

gcc-par-vect: Transformations Enhancing Vectorization and Parallelization

Some transformations increase the scope of parallelization and vectorization by either enabling them, or by improving their run time performance. Most important of such transformations are:

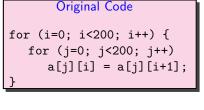

- Loop Interchange
- Loop Distribution
- Loop Fusion
- Peeling

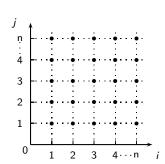

Loop Interchange

gcc-par-vect: Transformations Enhancing Vectorization and Parallelization

```
Original Code

for (i=0; i<200; i++) {
  for (j=0; j<200; j++)
   a[j][i] = a[j][i+1];
}
```

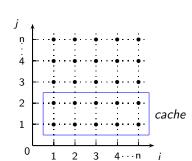

- Outer loop is vectorizable
- Mismatch between nesting order of loops and array access

```
Original Code

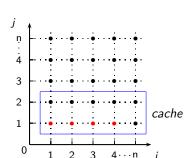

for (i=0; i<200; i++) {
  for (j=0; j<200; j++)
   a[j][i] = a[j][i+1];
}
```

- Outer loop is vectorizable
- Mismatch between nesting order of loops and array access

```
Original Code

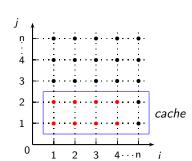

for (i=0; i<200; i++) {
  for (j=0; j<200; j++)
    a[j][i] = a[j][i+1];
}
```

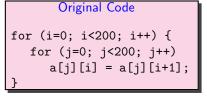

- Outer loop is vectorizable
- Mismatch between nesting order of loops and array access

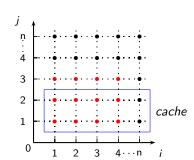

```
Original Code

for (i=0; i<200; i++) {
  for (j=0; j<200; j++)
    a[j][i] = a[j][i+1];
}
```

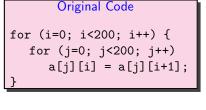

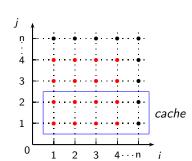

- Outer loop is vectorizable
- Mismatch between nesting order of loops and array access

- Outer loop is vectorizable
- Mismatch between nesting order of loops and array access

- Outer loop is vectorizable
- Mismatch between nesting order of loops and array access

```
Original Code

After Interchange

for (i=0; i<200; i++) {
  for (j=0; j<200; j++)  
    a[j][i] = a[j][i+1];
}
```

- Innermost loop is vectorizable
- Loop Interchange improves data locality

Loop Interchange for Parallelization

```
Original Code

for (i=1; i<n; i++) {
  for (j=0; j<n; j++)
        A[i][j] = A[i-1][j];
}
```

- Outer Loop dependence on i, can not be parallelized
- Inner Loop parallelizable, but synchronization barrier required

Total number of synchronizations required = n

Loop Interchange for Parallelization

```
A[i][j] = A[i-1][j];
```

for (j=0; j<n; j++)

Original Code

for (i=1; i<n; i++) {

Outer Loop - parallelizable

Total number of synchronizations required = 1

```
Original Code

for (i=0; i<230; i++) {
    S_1 : a[i+3] = a[i];
    S_2 : b[i] = c[i];
}
```

- True dependence in S_1 , no dependence in S_2
- Loop cannot be vectorized or parallelized, but S_2 can be vectorized and parallelized independently

Loop Distribution

```
Original Code

for (i=0; i<230; i++) {
    S_1 : a[i+3] = a[i];
    S_2 : b[i] = c[i];
}
```

- True dependence in S_1 , no dependence in S_2
- Loop cannot be vectorized or parallelized, but S_2 can be vectorized and parallelized independently

Compile with

gcc -02 -ftree-loop-distribution -fdump-tree-ldist

```

    goto <bb 4>;
                                   D.2694_5 = c[i_13];
  else
                                   b[i_13] = D.2694_5;
    goto <bb 5>;
                                   i_6 = i_13 + 1;
<bb 4>:
                                   if (i_6 != 230)
  goto <bb 3>;
                                     goto <bb 8>;
```

```
After Distribution

for (i=0; i<230; i++)

S<sub>1</sub> : a[i+3] = a[i];

for (i=0; i<230; i++)

S<sub>2</sub> : b[i] = c[i];
```

- ullet S_2 can now be independently parallelized or vectorized
- S₁ runs sequentially

Loop Fusion for Locality

```
Original Code

for (i=0; i<n; i++)
    for (j=0; j<n; j++)
        a[i][j] = b[i];

for (k=0; k<n; k++)
    for (1=0; 1<n; 1++)
    b[k] = a[k][1];
```

- Large reuse distance for array a and b, high chances of cache miss
- If loops i and k are parallelized, 2 synchronizations required
- Outer loops i and k can be fused
- Fusing inner loops j and 1 will introduce a spurious backward dependence on b

Loop Fusion for Locality

```
Original Code

for (i=0; i<n; i++)
    for (j=0; j<n; j++)
        a[i][j] = b[i];

for (k=0; k<n; k++)
    for (1=0; 1<n; 1++)
        b[k] = a[k][1];
```

```
Fused Code

for (i=0; i<n; i++) {
   for (j=0; j<n; j++)
      a[i][j] = b[i];
   for (l=0; l<n; l++)
      b[i] = a[i][l];
}
```

- · Reduced reuse distance for array a and b, low chances of cache miss
- If outer loop i is parallelized, only 1 synchronization required

Peeling for Vectorization

```
for (i=0; i<n; i++)
{
S_1: a[i+2] = b[i];
S_2: b[i+3] = a[i];
}
```

Original Code

```
a[i+2] = b[i]
\delta_1 \qquad \qquad \delta_1
b[i+3] = a[i]
```

- Cyclic Dependence, dependence distance for backward dependence
 3 < VF
- Cannot vectorize

Peeling for Vectorization

```
for (i=0; i<2; i++)

S_2: b[i+3] = a[i];

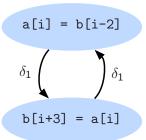

for (i=2; i<n-2; i++) {

S_1: a[i] = b[i-2];

S_2: b[i+3] = a[i];

}
```

Transformed Code

- Cyclic Dependence, dependence distance for backward dependence
 = 5 > VF
- Can vectorize

Peeling for Parallelization

```
Original Code

for (i=1; i<n; i++)
{
    S_1: a[i] = b[i];
    S_2: c[i] = a[i-1];
}
```

dependence on i, can not be parallelized

Total number of synchronizations required = n

Peeling for Parallelization

```
Original Code

for (i=1; i<n; i++)
{
    S_1: a[i] = b[i];
    S_2: c[i] = a[i-1];
}
```

```
Transformed Code

c[1] = a[0];

for (i=1; i<n-1; i++) {

S_1: a[i] = b[i];

S_2: c[i+1] = a[i];
}
```

Outer Loop parallelizable

Total number of synchronizations required = 1

Advanced Issues in Vectorization and Parallelization

Advanced Issues in Vectorization and Parallelization

- What code can be vectorized?
- How to force the alignment of data accesses for
 - compile time misalignment
 - run time misalignment
- How to handle undetermined aliases?
- When is vectorization profitable?
- When is parallelization profitable?

- What code can be vectorized?
- How to force the alignment of data accesses for
 - compile time misalignment
 - run time misalignment
- How to handle undetermined aliases?
- When is vectorization profitable?
- When is parallelization profitable?

Understanding the cost model of vectorizer and parallelizer

Unvectorizable Loops

```
int *a, *b;
int main() {
    while (*a != NULL)
    {
        *a++ = *b--;
    }
}
```

Unvectorizable Loops

```
int main() {
    while (*a != NULL)
    {
        *a++ = *b--;
    }
}
```

int *a, *b;

novec.c:6: note: not vectorized: number of iterations cannot be computed.

Reducing Compile Time Misalignment by Peeling

gcc-par-vect: Advanced Issues in Vectorization and Parallelization

```
int a[256], b[256];
int main ()
{
    int i;
    for (i=0; i<203; i++)
        a[i+2] = b[i+2];
}</pre>
```

66/81

int a[256], b[256];

gcc-par-vect: Advanced Issues in Vectorization and Parallelization

```
int main ()
     int i;
     for (i=0; i<203; i++)
         a[i+2] = b[i+2];
```

```
peel.c:5: note: misalign = 8 bytes of ref b[D.2836_4]
peel.c:5: note: misalign = 8 bytes of ref a[D.2836_4]
```

Reducing Compile Time Misalignment by Peeling

Observing the final decision about alignment

```
peel.c:5: note: Try peeling by 2
peel.c:5: note: Alignment of access forced using peeling.
peel.c:5: note: Peeling for alignment will be applied.
```

```
peel.c:5: note: known peeling = 2.
peel.c:5: note: niters for prologue loop: 2
peel.c:5: note: Cost model analysis:
    prologue iterations: 2
```

epilogue iterations: 2

Reducing Compile Time Misalignment by Peeling

An aligned vectorized code can consist of three parts

- Peeled Prologue Scalar code for alignment
- Vectorized body Iterations that are vectorized
- Epilogue Residual scalar iterations

if (ivtmp.7_13 >= D.2010_15)
  goto <bb 3>;
```

Start execution of iterations of the chosen thread

Parallelization and Vectorization in GCC : Conclusions

- Chain of recurrences seems to be a useful generalization
- Interaction between different passes is not clear due to fixed order
- Auto-vectorization and auto-parallelization can be improved by enhancing the dependence analysis framework
- Efficient cost models are needed to automate legal transformation composition
