

# CS 433 Automated Reasoning 2021

## Lecture 27: Interactive theorem proving

Instructor: Ashutosh Gupta

IITB, India

Compile date: 2021-11-02

# Limits of Automated solvers

There are **several issues** with SAT/SMT solvers.

- ▶ Not all logical questions can be automated.
- ▶ How can we trust SAT/SMT solvers, which are ensembles of optimizations? We need something more principled.

An **answer** to the above problems is **interactive theorem proving**.

# Interactive theorem prover

- ▶ A software that helps you in proving theorems
  - ▶ Designed with solid mathematical foundation.
- ▶ It can automatically do a few simple operations
- ▶ For the rest user **has to hint the actions.**

Please install **coqide** in your laptop.

# Tactics

- ▶ **Tactics** are intuitive hints that suggest actions to the prover.
- ▶ The sequences of tactics are called **proof scripts**.

Tactics are the “instruction set” for writing proof scripts.

Content borrowed from tutorial: <https://coq.inria.fr/tutorial-nahas>

# Topic 27.1

## Coq basics

# Introducing Coq proof script

```
Section Minimal_Logic.
```

```
Variables a b c : Prop.           (* declare proposition *)
```

```
Theorem trivial: a -> a.          (* simple theorem *)
```

```
Proof.                             (* start of proof *)
```

```
  intro proof_of_a.                (* introduces leading construct *)
```

```
  exact proof_of_a.
```

```
Qed.
```

This is not a proof!  
This is a proof script.

## Repeated intro and reuse results

**Theorem** reuse:  $b \rightarrow a \rightarrow a$ . (\* slightly complex theorem \*)

**Proof.**

**intro** proof\_of\_b.

**exact** trivial.

**Qed.**

**Theorem** no\_reuse:  $b \rightarrow a \rightarrow a$ . (\* using intros \*)

**Proof.**

**intros**.

**exact** H.

**Qed.**

# Introducing forall

(\* forall and implications are treated in a similar way!! \*)

**Theorem** demoAll: (forall x: Prop, x  $\rightarrow$  b  $\rightarrow$  x).

**Proof.**

**intros** y. (\* first introduce quantified variable \*)

**intros** some\_name pb.

**exact** some\_name.

**Qed.**

**Commentary:** Declaring variables outside of the theorem and declaring forall seems to have same effect. Only difference is the scope.

# Proof state

## Forward proving

```
(* learning pose *)  
Theorem non_trivial: a -> (a->b) -> b.  
Proof.  
  intros pa pab.  
  pose (pb := pab pa).      (* pose applies known facts! *)  
  exact pb.  
Qed.
```

### Exercise 27.1

*Prove the following theorem.*

```
Theorem ex_1 : (forall A B C : Prop, A -> (A->B) -> (A->B->C) -> C).
```

# We can see the proof in progress!!

**Theorem** non\_trivial:  $a \rightarrow (a \rightarrow b) \rightarrow b$ .

**Proof.**

**Show Proof.**

**intros** pa pab.

**Show Proof.** (\* shows the current proof term \*)

**pose** (pb := pab pa).

**Show Proof.**

**exact** pb.

**Qed.**

## Proof state and proof term (contd.)

In the previous example, the following is the proof state at the second Show Proof.

```
1 subgoal
a, b, c : Prop
pa : a
pab : a -> b
----- (1/1)
b
```

Proof term at the same time.

```
(fun (pa : a) (pab : a -> b) => ?Goal)
```

## Proof state and proof term

Thereafter, the following is the proof state after applying `pose (pb := pab pa)`.

```
1 subgoal
a, b, c : Prop
pa : a
pab : a -> b
pb := pab pa : b
----- (1/1)
b
```

Proof term at the same time.

```
(fun (pa : a) (pab : a -> b) =>
  let p_b := pab pa : b in
  ?Goal
)
```

## Reverse proving

```
(* learning refine *)  
Theorem non_trivial: a -> (a->b) -> b.  
Proof.  
  intros pa pab.  
  refine (pab _).    (* what do we need to prove the goal? *)  
  exact pa.  
Qed.
```

### Exercise 27.2

*Prove the following theorem using refine.*

```
Theorem ex_1 : (forall A B C : Prop, A -> (A->B) -> (A->B->C) -> C).
```

## Reverse proving using apply

```
(* learning apply *)
```

```
Theorem non_trivial: a -> (a->b) -> b.
```

```
Proof.
```

```
  intros pa pab.
```

```
  apply pab.      (* same as refine without explicit patterns *)
```

```
  exact pa.
```

```
Qed.
```

# Coq basics

- ▶ Proofs are functional programs
  - ▶ Curry-Howard isomorphism
- ▶ Universal quantifiers and implications are base connectives
  - ▶ Almost everything can be written using them except “negation”
- ▶ Let us see what we need to add to encode negation.

## Topic 27.2

### Negation and False

## Negation is defined using “False”

- ▶ We can define  $\neg A$  as  $A \Rightarrow \text{False}$
- ▶ We need to define False and also True
- ▶ They are defined using the following constructs:

```
Inductive False : Prop := .
```

```
Inductive True : Prop :=  
| I : True.
```

Inductive is used to define instances of types.

False has **no way of proving**.

True can be proven using I, which can be **always proven**.

**Commentary:** Inductive is yet another fundamental idea in Coq. Now take it as presented. Let us be more familiar with the system before having clearer understanding.

## Negation is defined using “False” II

- Negation is defined as follows

**Definition** `not (A:Prop) := A -> False.` (\* macro that defines not \*)

**Notation** `"~ x" := (not x) : type_scope.` (\* syntactic sugar for not \*)

# Understanding “False” and “True”

Our usual Boolean will be defined later.

In Coq, they actually mean unprovable and provable.

```
Theorem True_can_be_proven : True.
```

```
Proof.
```

```
  exact I. (* True can be matched with I, which is always there*)
```

```
Qed.
```

```
Theorem False_can_never_be_proven : ~ False.
```

```
Proof.
```

```
  unfold not. (* unfold expands predefined macros *)
```

```
  intros pf.
```

```
  exact pf.
```

```
Qed.
```

# Let us prove a few facts about True and False

We have setup a world of True and False. Do they match our intuition?

```
Theorem thm_T_imp_T : True -> True.
```

Proof.

```
  intros proof_of_True.
```

```
  exact I.
```

Qed.

```
Theorem thm_F_imp_F : False -> False.
```

Proof.

```
  intros pf.
```

```
  case pf. (* "exact pf." works, but is not recommended. *)
```

Qed.

## Exercise 27.3

*Prove the following theorems.*

```
Theorem thm_F_imp_T : False -> True.
```

```
Theorem thm_T_imp_F : ~ (True -> False).
```

# Reducto ad absurdum

If you can derive contradiction, you can derive anything.

**Theorem** absurd : forall A C : Prop, A -> ~ A -> C.

**Proof.**

intros A C.

intros pa p\_nota.

unfold not in p\_nota.

pose (pf := p\_nota pa).

case pf.

**Qed.**

## Topic 27.3

### Defining Or/And over Prop

## or/and are defined as follows

Back to propositions....

or can be constructed in two ways

```
Inductive or ( A B : Prop ) : Prop :=  
| or_introl : A -> A \ / B  
| or_intror : B -> A \ / B  
where "A \ / B" := (or A B) : type_scope.
```

and has only one construction

```
Inductive and ( A B : Prop ) : Prop :=  
  conj : A -> B -> A /\ B  
where "A /\ B" := (and A B) : type_scope.
```

$\wedge$  and  $\vee$  are shorthands.

## A few theorems on or

**Theorem** left\_or : (**forall** A B : **Prop**, A  $\rightarrow$  A  $\vee$  B).

**Proof.**

**intros** A B.

**intros** pa.

**pose** (pab := or\_introl pa : A  $\vee$  B).

**exact** pab.

**Qed.**

pose needs type declaration because or\_introl does not have full type information.

### Exercise 27.4

*Prove the following theorems using refine or apply.*

**Theorem** right\_or : (**forall** A B : **Prop**, B  $\rightarrow$  A  $\vee$  B).

**Theorem** both\_and : (**forall** A B : **Prop**, A  $\rightarrow$  B  $\rightarrow$  A  $\wedge$  B).

# Or/And commutes

**Theorem** `or_commutes` : (`forall` A B, A  $\vee$  B  $\rightarrow$  B  $\vee$  A).

**Proof.**

```
intros A B.
intros A_or_B.
case A_or_B. (* creates two subgoals for each constructor of  $\vee$  *)
  intros pa.      (*suppose A_or_B is (or_introl proof_of_A) *)
  refine (or_intror _).
    exact pa.

  intros pb.      (*suppose A_or_B is (or_intror proof_of_B) *)
  refine (or_introl _).
    exact pb.
```

**Qed.**

## Exercise 27.5

*Prove the following theorem.*

**Theorem** `and_commutes` : (`forall` A B, A  $\wedge$  B  $\rightarrow$  B  $\wedge$  A).

## destruct tactic

**Theorem** and\_commutates\_again : (forall A B, A /\ B -> B /\ A).

**Proof.**

intros A B.

intros A\_and\_B.

destruct A\_and\_B as [ pa pb].

refine (conj \_ \_).

exact pa.

exact pb.

Qed.

destruct combines the work of  
case and subsequent intros.

## Topic 27.4

### Booleans

# The Booleans we know!

Boolean is **already** defined as follows.

```
Inductive bool : Set :=  
| true  : bool  
| false : bool.
```

To import the above definitions and many more, we need to add.

```
Require Import Bool.
```

## The Booleans we know!(II)

The import loads the following two import functions

```
(* Defines equality over Booleans *)  
Definition eqb (b1 b2:bool) : bool :=  
match b1, b2 with  
| true, true => true  
| true, false => false  
| false, true => false  
| false, false => true  
end.
```

```
(* maps Booleans to provability *)  
Definition Is_true (b:bool) :=  
match b with  
| true => True  
| false => False  
end.
```

# Let us prove some theorems on Booleans

**Theorem** true\_is\_True: Is\_true true.

**Proof.**

**simpl.** (\* executes the head function at the goal \*)

**exact** I.

**Qed.**

**Theorem** not\_eqb\_true\_false:  $\sim$  (Is\_true (eqb true false)).

**Proof.**

**simpl.**

**exact** False\_cannot\_be\_proven.

**Qed.**

## Another simple theorem on Booleans

**Theorem** eqb\_a\_a : (forall a : bool, Is\_true (eqb a a)).

**Proof.**

intros a.

case a. (\* creates two subgoals for each value of bool \*)

simpl.

exact I.

simpl.

exact I.

**Qed.**

case only works if a is not referred  
anywhere else in the context.

### Exercise 27.6

*Prove the following theorem.*

**Theorem** ex\_4: (forall a:bool, (Is\_true (eqb a true))  $\rightarrow$  (Is\_true a)).

## Topic 27.5

Exists

# Existence

**Inductive** `ex (A:Type) (P:A → Prop) : Prop :=`  
`ex_intro : forall x:A, P x → ex (A:=A) P.`

**Notation** "'exists' x .. y , p" := (ex (fun x => .. (ex (fun y => p)) ..))  
(at level 200, x binder, right associativity,  
format "'[' 'exists' '/ ' x .. y , '/ ' p ']'")  
: type\_scope.

- ▶ For any  $x:A$  if we can show  $P\ x$ , then we have  $\text{ex } P$
- ▶ `ex` constructor is `ex_intro`
- ▶ `exists` is shorthand notation for `ex`

## A proof for existence!

How coq knows  
types of a and b?

**Theorem** thm\_forall\_exists : (forall b, (exists a, Is\_true(eqb a b) ) ).

**Proof.**

```
intros b.
```

```
case b.
```

```
(* b is true *)
```

```
pose (witness := true).
```

```
refine (ex_intro _ witness _).
```

```
simpl.
```

```
exact I.
```

```
(* b is false *)
```

```
pose (witness := false).
```

```
refine (ex_intro _ witness _).
```

```
simpl.
```

```
exact I.
```

**Qed.**

## An important property of exists

**Theorem** fe:  $(\text{forall } P : \text{Set} \rightarrow \text{Prop}, (\text{forall } x, \sim (P\ x)) \rightarrow \sim (\text{exists } x, P\ x)).$

**Proof.**

```
intros P.
intros forall_x_not_Px.
unfold not.
intros exists_x_Px.
destruct exists_x_Px as [ witness proof_of_Pwitness].
pose (not_Pwitness := forall_x_not_Px witness).
unfold not in not_Pwitness.
pose (proof_of_False := not_Pwitness proof_of_Pwitness).
case proof_of_False.
```

**Qed.**

### Exercise 27.7

*Prove the following theorem.*

**Theorem** ef:  $(\text{forall } P : \text{Set} \rightarrow \text{Prop}, \sim (\text{exists } x, P\ x) \rightarrow (\text{forall } x, \sim (P\ x))).$

## Topic 27.6

### Equality

# Equality and inequality

- Equality is also defined object.

```
Inductive eq (A:Type) (x:A) : A -> Prop :=  
eq_refl : x = x :> A
```

```
where "x = y :> A" := (@eq A x y) : type_scope.
```

```
Notation "x = y" := (x = y :>_) : type_scope.
```

- Once two things become equal they are same constants.
- Inequality is defined as follows.

```
Notation "x <> y :> T" := (~ x = y :> T) : type_scope.
```

```
Notation "x <> y" := (x <> y :>_) : type_scope.
```

# Proving with equality

**Theorem** `thm_eq_sym` : (`forall` `x y` : `Set`, `x = y`  $\rightarrow$  `y = x`).

**Proof.**

```
  intros x y x_y.
```

```
  destruct x_y as [].
```

```
  exact (eq_refl x).
```

**Qed.**

## Topic 27.7

### Induction

# Defining natural numbers

Let us see our first true inductive definition that defines natural numbers.

```
Inductive nat : Set :=  
| 0 : nat  
| S : nat -> nat.
```

- ▶ 0 is zero and S is successor function.
- ▶ Natural numbers as terms over the symbols, e.g., 3 is  $S(S(S(0)))$ .
- ▶ Addition is defined as following function.

```
Fixpoint plus (n m:nat) : nat :=  
match n with  
| 0 => m  
| S p => S (p + m)  
end
```

```
where "n + m" := (plus n m) : nat_scope.
```

# Numbers and terms

Numbers are defined as terms. However, one can write them as **usual numbers** and they are **interpreted as the terms**.

**Theorem** `plus_2_3` :  $(S (S 0)) + (S (S (S 0))) = (S (S (S (S (S 0)))))$ .

**Proof.**

`simpl.`

`exact (eq_refl 5).`

**Qed.**

## Proving with inductive definitions.

**Theorem** `plus_0_n` : (`forall` `n`,  $0 + n = n$ ).

**Proof.**

`intros` `n`.

`simpl`.

`exact` (`eq_refl` `n`).

**Qed.**

Can we prove the following using the same tactics?

**Theorem** `plus_n_0` : (`forall` `n`,  $n + 0 = n$ ).

# Induction principle

In Coq induction principle for natural numbers is defined as follows.

```
nat_ind
: forall P : nat -> Type,
  P 0 -> (forall n : nat, P n -> P (S n)) -> forall n : nat, P n
```

# Applying induction principle

**Theorem** `plus_n_0` : (`forall` `n`, `n + 0 = n`).

**Proof.**

```
intros n.
```

```
elim n. (* applies induction hypothesis on the nat definition *)  
      (* first subgoal: base case *)
```

```
simpl.
```

```
exact (eq_refl 0).
```

```
  
(* second subgoal: inductive case *)
```

```
intros n'. (* must use fresh name to instantiate *)
```

```
intros inductive_hypothesis.
```

```
simpl.
```

```
rewrite inductive_hypothesis.
```

```
exact (eq_refl (S n')).
```

**Qed.**

## Exercise 27.8

*Prove the following theorem.*

**Theorem** `plus_sym`: (`forall` `n m`, `n + m = m + n`).

## Topic 27.8

### Datatypes

## Defining datatypes

Like natural numbers, other objects are also defined inductively. For example,

```
Inductive list (A : Type) : Type :=  
| nil : list A  
| cons : A -> list A -> list A.
```

```
Infix "::" := cons (at level 60, right associativity) : list_scope.
```

- ▶ `nil` is for empty list and `cons` extends a list.
- ▶ `::` is shorthand for `cons`.
- ▶ List length is defined as the following function.

```
Definition length (A : Type) : list A -> nat :=  
fix length l :=  
match l with  
| nil => 0  
| _ :: l' => S (length l')  
end.
```

## Other functions on lists

**Definition** `hd (A : Type) (default : A) (l : list A) :=`

```
match l with
| nil => default
| x :: _ => x
end.
```

**Definition** `tl (A : Type) (l : list A) :=`

```
match l with
| nil => nil
| a :: m => m
end.
```

**Definition** `app (A : Type) : list A -> list A -> list A :=`

```
fix app l m :=
match l with
| nil => m
| a :: l1 => a :: app l1 m
end.
```

**Infix** `"++" := app (right associativity, at level 60) : list_scope.`

# A simple theorem on lists

**Theorem** `hd_tl` :

```
(forall A:Type,  
  (forall (default : A) (x : A) (lst : list A),  
    (hd A default (x::lst)) :: (tl A (x::lst)) = (x :: lst))).
```

**Proof.**

```
intros A.  
intros default x lst.  
simpl.  
exact (eq_refl (x::lst)).
```

**Qed.**

## Topic 27.9

### Problem

# Propositions

## Exercise 27.9

*Prove the following theorems.*

**Theorem** p1 : ( $\text{forall } A B : \text{Prop}, (A \rightarrow B) \rightarrow (\sim B \rightarrow \sim A)$  ).

**Theorem** p2 : ( $\text{forall } A B : \text{Prop}, (A \vee B) \wedge (C \vee D) \rightarrow ((A \wedge C) \vee B \vee D)$  ).

# Odd and even

## Exercise 27.10

*Using Coq formalize definition of odd and even numbers. Subsequently, prove the following theorems*

- ▶ 5 is an odd number.
- ▶ No number is both odd and even.
- ▶ Between every two odd numbers there is **at least one** even number.
- ▶ Between every two consecutive even numbers there is **exactly one** odd number.
- ▶ There is no largest even number.

# Proving arithmetic correct!

## Exercise 27.11

*Using Coq formalize following definitions*

- ▶ Define natural numbers as list of digits, e.g., `zero::nine::one` is 190.
- ▶ Define primary school algorithms for addition, subtraction, and multiplication over the lists.

And prove that the algorithms are correct with respect to the native natural numbers and arithmetic operations defined in Coq.

For clarifications: please contact the instructor.

End of Lecture 27
