Topic 18.1

Game of terms

## CNF formulas and proofs

### Example 18.1

Recall we had a proof for  $\emptyset \vdash (\forall x. (P(x) \lor Q(x)) \Rightarrow \exists x. P(x) \lor \forall x. Q(x)).$ 

Let us try to prove it via FOL CNF.

We first take negation of the formula and transform it into FOL CNF. We obtain

$$\Sigma \triangleq \{ \forall x. \ (P(x) \lor Q(x)), \forall x. \neg P(x), \neg Q(c) \}$$

We have written each clause as a separate formula without dropping quantifiers.

We show that we can derive contradiction from  $\Sigma$ .

# CNF formulas and proofs

Recall

$$\Sigma \triangleq \{ \forall x. \ (P(x) \lor Q(x)), \forall x. \neg P(x), \neg Q(c) \}$$

Here is a proof that derives contradiction from  $\Sigma$ .

1. 
$$\Sigma \vdash \neg Q(c)$$
 Assumption

2. 
$$\Sigma \vdash \forall x. (P(x) \lor Q(x))$$

$$Q(x) \lor Q(x)$$
 Assumption  $\forall Q(x)$   $\forall$ -Elim applied to 2

3. 
$$\Sigma \vdash P(x) \lor Q(x)$$
  
4.  $\Sigma \vdash \forall x. \neg P(x)$ 

Assumption 
$$\forall$$
-Elim applied to 4

 $\land$ -Intro applied to 1 and 8

5. 
$$\Sigma \vdash \neg P(x)$$

6. 
$$\Sigma \vdash Q(x)$$
 Resolution applied to 3 and 5

7. 
$$\Sigma \vdash \forall x. \ Q(x)$$

$$\vdash \forall x. \ Q(x)$$
  $\forall$ -Intro applied to 6  $\vdash Q(c)$   $\forall$ -Elim applied to 7

8. 
$$\Sigma \vdash Q(c)$$
  
9.  $\Sigma \vdash Q(c) \land \neg Q(c)$ 

# Example: an extreme example for finding a magic term.

### Example 18.2

Let us derive contradiction from the following.

Let 
$$\Sigma = \{ \forall x_4, x_3, x_2, x_1. \ f(x_1, x_3, x_2) \neq f(g(x_2), j(x_4), h(x_3, a)) \}$$

Let us construct a proof for the above.

1. 
$$\Sigma \vdash \forall x_4, x_3, x_2, x_1. \ f(x_1, x_3, x_2) \neq f(g(x_2), j(x_4), h(x_3, a))$$

1. 
$$Z \vdash \forall x_4, x_3, x_2, x_1, T(x_1, x_3, x_2) \neq T(g(x_2), f(x_4), T(x_3, a))$$

2. 
$$\Sigma \vdash \forall x_3, x_2, x_1. \ f(x_1, x_3, x_2) \neq f(g(x_2), j(x_4), h(x_3, a))$$

3. 
$$\Sigma \vdash \forall x_2, x_1. \ f(x_1, j(x_4), x_2) \neq f(g(x_2), j(x_4), h(j(x_4), a))$$

4. 
$$\Sigma \vdash \forall x_1. \ f(x_1, j(x_4), h(j(x_4), a)) \neq f(g(h(j(x_4), a)), j(x_4), h(j(x_4), a))$$
  $\forall$ -Elim applied to 3

5. 
$$\Sigma \vdash f(g(h(j(x_4), a)), j(x_4), h(j(x_4), a)) \neq f(g(h(j(x_4), a)), j(x_4), h(j(x_4), a))$$
  $\forall$ -Elim applied to 4

## Exercise 18.1

Finish the proof using Reflex and derive contradiction.

We need a mechanism to auto detect substitutions such that terms with variables become equal adiction.

 $\forall$ -Elim applied to 1

∀-Elim applied to 2

## How to find the magic terms?

In the previous, example we were asked to equate terms

$$f(x_1, x_3, x_2)$$
 and  $f(g(x_2), j(x_4), h(x_3, a))$ 

by mapping variables  $x_1$ ,  $x_2$ ,  $x_3$ , and  $x_4$  to terms.

The process of equating terms is called **unification**.

Sometimes, the unification may not even be possible.

Topic 18.2

Unification

Unification

# Making terms equal by substitution

## Unifier

#### Definition 18.1

For terms t and u, a substitution  $\sigma$  is a unifier of t and u if  $t\sigma=u\sigma$ .

We say t and u are unifiable if there is a unifier  $\sigma$  of t and u.

## Example 18.3

Find a unifier  $\sigma$  of the following terms

$$ightharpoonup x_4 \sigma = f(x_1) \sigma$$

$$\triangleright x_4 \sigma = f(x_1) \sigma$$

$$g(x_1)\sigma = f(x_1)\sigma$$

$$ightharpoonup x_1 \sigma = f(x_1) \sigma$$

$$\sigma = \{x_1 \mapsto c, x_4 \mapsto f(c)\}$$

$$\sigma = \{x_1 \mapsto x_2, x_4 \mapsto f(x_2)\}$$

not unifiable

not unifiable

### Definition 18.2

Let  $\sigma_1$  and  $\sigma_2$  be substitutions.  $\sigma_1$  is more general than  $\sigma_2$  if there is a substitution  $\tau$  such that  $\sigma_2 = \sigma_1 \tau$ . We write  $\sigma_1 \ge \sigma_2$ .

#### Example 18.4

- ▶  $\sigma_1 = \{x \mapsto f(y, z)\} \ge \sigma_2 = \{x \mapsto f(c, g(z)), y \mapsto c, z \mapsto g(z)\}$  because  $\sigma_2 = \sigma_1\{y \mapsto c, z \mapsto g(z)\}.$

#### Exercise 18.2

If  $\sigma_1 \geq \sigma_2$  and  $\sigma_2 \geq \sigma_3$ . Then,  $\sigma_1 \geq \sigma_3$ .

# Most general unifier (mgu)

Is mgu unique? Does mgu always exist?

## Definition 18.3

Let t and u be terms with variables, and  $\sigma$  be a unifier of t and u.  $\sigma$  is most general unifier(mgu) of u and t if it is more general than any other unifier.

## Example 18.5

Consider terms f(x, g(y)) and f(g(z), u). The following are unifiers of the terms.

- 1.  $\sigma_1 = \{x \mapsto g(z), u \mapsto g(y), z \mapsto z, y \mapsto y\}$
- 2.  $\sigma_2 = \{x \mapsto g(c), u \mapsto g(d), z \mapsto c, y \mapsto d\}$
- 3.  $\sigma_3 = \{x \mapsto g(z), u \mapsto g(z), z \mapsto z, y \mapsto z\}$

where c and d are constants.

Please note  $\sigma_1 \geq \sigma_2$  and  $\sigma_1 \geq \sigma_3$ .  $\sigma_2 \not\geq \sigma_3$  and  $\sigma_3 \not\geq \sigma_2$ .(why?)

# Uniqueness of mgu

#### Definition 18.4

A substitution  $\sigma$  is a renaming if  $\sigma$ : Vars  $\to$  Vars and  $\sigma$  is one-to-one

#### Theorem 18.1

If  $\sigma_1$  and  $\sigma_2$  are mgus of u and t. Then there is a renaming  $\tau$  such that  $\sigma_1 \tau = \sigma_2$ .

#### Proof.

- Since  $\sigma_1$  is mgu, therefore there is a substitution  $\hat{\sigma_1}$  such that  $\sigma_2 = \sigma_1 \hat{\sigma_1}$ .
- Since  $\sigma_2$  is mgu, therefore there is a substitution  $\hat{\sigma_2}$  such that  $\sigma_1 = \sigma_2 \hat{\sigma_2}$ .
- Therefore  $\sigma_1 = \sigma_1 \hat{\sigma_1} \hat{\sigma_2}$ . (And also,  $\sigma_2 = \sigma_2 \hat{\sigma_2} \hat{\sigma_1}$ .)

Without loss of generality, for each  $y \in \text{Vars}$ , if  $y \notin FV(x\sigma_1)$  for each  $x \in \text{Vars}$ , then we assume  $y\hat{\sigma_1} = y$ .

# Uniqueness of mgu (contd.)

## Proof(contd.)

**claim:** for each  $y \in Vars$ ,  $y\hat{\sigma_1} \in Vars$ 

Consider a variable x such that  $y \in FV(x\sigma_1)$ . Three possibilities for  $y\hat{\sigma_1}$ .

- 1. If  $y\hat{\sigma_1} = f(..)$ ,  $x\sigma_1\hat{\sigma_1}$  is longer than  $x\sigma_1$ . Therefore,  $x\sigma_1\hat{\sigma_1}\hat{\sigma_2}$  is longer than  $x\sigma_1$ . Contradiction.
- 2. If  $y\hat{\sigma_1} = c$ ,  $\hat{\sigma_2}$  will not be able to rename c back to y in  $x\sigma_1$ .
- 3. Therefore, we must have the third possibility, i.e.,  $y\hat{\sigma_1} \in Vars$  is a variable.

**claim:** for each  $y_1 \neq y_2 \in \text{Vars}$ ,  $y_1 \hat{\sigma_1} \neq y_2 \hat{\sigma_1}$ 

Assume  $y_1\hat{\sigma_1} = y_2\hat{\sigma_1}$ .  $\hat{\sigma_2}$  will not be able to rename the variables back to distinct variables. (why?) Contradiction.

 $\hat{\sigma_1}$  is a renaming.

# Topic 18.3

Unification algorithm

## How to find unifiers?

We need to identify where terms are not in agreement.

Apply substitutions to fix the disagreement.

# Disagreement pairs

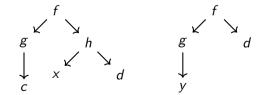

#### Definition 18.5

For terms t and u,  $d_1$  and  $d_2$  are disagreement pair if

- 1.  $d_1$  and  $d_2$  are subterms of t and u respectively.
- 2. the path to  $d_1$  in t is same as and the path to  $d_2$  in u, and
- 3. roots of  $d_1$  and  $d_2$  are different.

## Example 18.6

Consider terms t = f(g(c), h(x, d)) and u = f(g(y), d)

Disagreement pairs: h(x, d) and d @(P)(S)(D)

Disagreement pairs: c and y IITB. India

# Robinson algorithm for computing mgu

# Algorithm 18.1: $MGU(t, u \in T_S)$

$$\sigma := \{\};$$
 while  $t\sigma \neq u\sigma$  do

choose disagreement pair  $d_1$ ,  $d_2$  in  $t\sigma$  and  $u\sigma$ ;

if both 
$$d_1$$
 and  $d_2$  are non-variables then return FAIL; if  $d_1 \in \mathsf{Vars}$  then

 $\sigma := \sigma\{\mathbf{x} \mapsto \mathbf{s}\}$ 

$$x := d_1; s := d_2;$$

$$s := a$$

$$x := d_2; s := d_1;$$

if  $x \in FV(s)$  then return FAIL;

# return $\sigma$ Exercise 18.3

else

#### Let $\sigma_0$ , $\sigma_1$ ,... be the sequence of observed substitutions during the run of MGU. Show $\sigma_i \geq \sigma_{i+1}$ . @(P)(S)(9) CS228 Logic for Computer Science 2021

17

// update the substitution

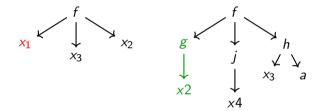

If MGU is sound and always terminates then

mgus for unifiable terms always exist.

# Example: run of Robinson's algorithm

## Example 18.7

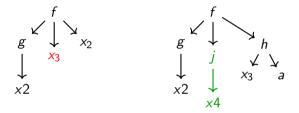

Consider call  $MGU(f(x_1, x_3, x_2), f(g(x_2), j(x_4), h(x_3, a)))$ Initial  $\sigma = \{\}$ 

Disagreement pairs := {  $(x_1, g(x_2)), (x_3, j(x_4)), (x_2, h(x_3, a))$  } Choose a disagreement pair:  $(\mathbf{x_1}, g(x_2))$ After update  $\sigma = {\mathbf{x_1} \mapsto g(x_2)}$ Input terms after applying  $\sigma$ :  $f(g(x_2), x_3, x_2)$  and  $f(g(x_2), j(x_4), h(x_3, a))$ 

# Example: run of Robinson's algorithm II (contd.)

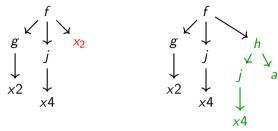

Input terms now:

```
Disagreement pairs in the new terms:= \{(x_3, j(x_4)), (x_2, h(x_3, a))\}
Choose a disagreement pair: (x_3, j(x_4))
After update \sigma = \{x_1 \mapsto g(x_2), x_3 \mapsto j(x_4)\}
Input terms after applying \sigma: f(g(x_2), j(x_4), x_2) and f(g(x_2), j(x_4), h(j(x_4), a))
```

# Example: run of Robinson's algorithm III(contd.)

Input terms now:

Choose the last disagreement pair:  $(x_2, h(j(x_4), a))$ .

Since the mapping of  $x_1$  refers to  $x_2$  in old  $\sigma$ , it is also updated. After applying new mapping  $\sigma := \sigma\{x_2 \mapsto h(j(x_4), a)\}$  $= \{x_1 \mapsto g(x_2), x_3 \mapsto j(x_4)\}\{x_2 \mapsto h(j(x_4), a)\}$ 

Terms after applying 
$$\sigma$$
:  $f(g(h(j(x_4), a)), j(x_4), h(j(x_4), a))$  and  $f(g(h(j(x_4), a)), j(x_4), h(j(x_4), a))$   
Since no disagreement pairs, we are done.

 $= \{x_1 \mapsto g(h(i(x_4), a)), x_3 \mapsto i(x_4), x_2 \mapsto h(i(x_4), a)\}$ 

# Unification in proving

## Example 18.8

Consider again 
$$\forall x_1, x_2, x_3, x_4$$
.  $f(x_1, x_3, x_2) \neq f(g(x_2), j(x_4), h(x_3, a))$ 

Given the above, one may ask

Are 
$$f(x_1, x_3, x_2)$$
 and  $f(g(x_2), j(x_4), h(x_3, a))$  unifiable?

If we run the unification algorithm on the above terms, we obtain

- $ightharpoonup x_1 \mapsto g(h(j(x_4), a))$
- $ightharpoonup x_2 \mapsto h(j(x_4), a)$
- $ightharpoonup x_3 \mapsto j(x_4)$

We will integrate unification with a simpler resolution proof system.

The above instantiations are not magic anymore!

# Topic 18.4

Correctness of Robinson algorithm

### Termination of MGU

#### Theorem 18.2

MGU always terminates.

#### Proof.

Total number of variables in  $t\sigma$  and  $u\sigma$  decreases in every iteration. (why?)

Since initially there were finite variables in t and u, MGU terminates.

## Soundness of MGU

#### Theorem 18.3

MGU(t, u) returns unifier  $\sigma$  iff t and u are unifiable. Furthermore,  $\sigma$  is a mgu.

#### Proof.

Since MGU must terminate, if t and u are not unifiable then MGU must return FAIL.

Let us suppose t and u are unifiable and  $\tau$  is a unifier of t and u.

**claim:**  $\tau = \sigma \tau$  is the loop invariant of MGU.

#### base case:

Initially,  $\sigma$  is identity. Therefore, the invariant holds initially.

#### induction step:

Induction hypothesis:  $\tau = \sigma \tau$  holds at the loop head.

# Soundness of MGU(contd.)

## Proof(contd.)

**claim:**  $t\sigma$  and  $u\sigma$  are unifiable.

$$\underbrace{t\sigma\tau}_{\text{Ind. Hyp.}}\underbrace{t\tau}_{\text{Assumption Ind. Hyp.}}\underbrace{u\sigma\tau}_{\text{Ind. Hyp.}}.$$

claim:  $x\tau = s\tau$ .

Since  $t\sigma\tau=u\sigma\tau$ , and x and s are disagreement pairs in  $t\sigma$  and  $u\sigma$ ,  $x\tau=s\tau$ .

claim:  $\{x \mapsto s\}\tau = \tau$ .

Choose  $y \in Vars$ .

- ▶ If y = x,  $y\{x \mapsto s\}\tau = s\tau = x\tau = y\tau$ .

Therefore,  $\{x \mapsto s\}_{\tau} = \tau$ .

# Soundness of MGU(contd.)

## Proof(contd.)

We now show that if we assume the invariant at the loop head, then FAIL is not returned.

claim: no FAIL at the first if condition

One of  $d_1$  and  $d_2$  is a variable. Otherwise  $t\sigma$  and  $u\sigma$  are not unifiable.

claim: no FAIL at the last if condition

Since  $x\tau = s\tau$ , x cannot occurs in s. Otherwise, no unifier can make them equal(why?).

# Soundness of MGU(contd.)

## Proof(contd.)

Since there is no fail, we show that invariant will continue to hold after the iteration.

claim:  $\sigma\{x \mapsto s\}\tau = \tau$ 

Since  $\{x \mapsto s\}\tau = \tau$ ,  $\sigma\{x \mapsto s\}\tau = \sigma\tau$ . By induction hypothesis,  $\sigma\{x \mapsto s\}\tau = \tau$ .

Due to the invariant  $\tau = \sigma \tau$ ,  $\sigma$  is mgu at the termination.

Topic 18.5

**Problems** 

## **MGU**

#### Exercise 18.4

Find mgu of the following terms

- 1.  $f(g(x_1), h(x_2), x_4)$  and  $f(g(k(x_2, x_3)), x_3, h(x_1))$
- 2. f(x, y, z) and f(y, z, x)
- 3. MGU(f(g(x), x), f(y, g(y)))

#### Exercise 18.5

Let  $\sigma_1$  and  $\sigma_2$  be the MGUs in the above exercise. Give unifiers  $\sigma_1'$  and  $\sigma_2'$  for the problems respectively such that they are not MGUs. Also give  $\tau_1$  and  $\tau_2$  such that

- 1.  $\sigma_1' = \sigma_1 \tau_1$
- 2.  $\sigma_2' = \sigma_2 \tau_2$

## Maximum and minimal substitutions

#### Exercise 18.6

- a. Give two maximum general substitutions and two minimal general substitutions.
- b. Show that maximum general substitutions are equivalent under renaming.

## Multiple unification

#### Definition 18.6

Let  $t_1,..,t_n$  be terms. A substitution  $\sigma$  is a unifier of  $t_1,..,t_n$  if  $t_1\sigma=..=t_n\sigma$ .

We say  $t_1, ..., t_n$  are unifiable if there is a unifier  $\sigma$  of them.

#### Exercise 18.7

Write an algorithm for computing multiple unifiers using the binary MGU.

### Concurrent unification

#### Definition 18.7

Let  $t_1, ..., t_n$  and  $u_1, ..., u_n$  be terms. A substitution  $\sigma$  is a concurrent unifier of  $t_1, ..., t_n$  and  $u_1, ..., u_n$  if

$$t_1\sigma=u_1\sigma, \quad .., \quad t_n\sigma=u_n\sigma.$$

We say  $t_1, ..., t_n$  and  $u_1, ..., u_n$  are concurrently unifiable if there is a unifier  $\sigma$  for them.

#### Exercise 18.8

Write an algorithm for concurrent unifiers using the binary MGU.

# Saturating substitutions

#### Exercise 18.9

Consider a substitution  $\sigma$ . Let  $\sigma^1 = \sigma$  and  $\sigma^{i+1} = \sigma^i \sigma$ . Prove/disprove: for each  $\sigma$  there is a number n such that for each number k > n,  $\sigma^k = \sigma^i$  for some number  $i \le n$ .

## Topic 18.6

Extra slides: algorithms for unification

## Robinson is exponential

Robinson algorithm has worst case exponential run time.

## Example 18.9

Consider unification of the following terms  $f(x_1, g(x_1, x_1), x_2, ....)$  $f(g(y_1, y_1), y_2, g(y_2, y_2), ....)$ 

#### The mgu:

- $ightharpoonup x_1 \mapsto g(y_1, y_1)$
- $> y_2 \mapsto g(g(y_1, y_1), g(y_1, y_1))$
- .... (size of term keeps doubling)

After discovery of a substitution  $x \mapsto s$ , Robinson checks if  $x \in FV(s)$ . Therefore, Robinson has worst case exponential time.

# Martelli-Montanari algorithm

#### This algorithm is lazy in terms of applying occurs check

## Algorithm 18.2: $MM-MGU(t, u \in T_S)$

$$\sigma := \lambda x.x$$
;  $M = \{t = u\}$ ; while change in  $M$  or  $\sigma$  do

### $\mathbf{if} \quad f(t, t) = f(u, u) \in M$

if 
$$f(t_1,...t_n) = f(u_1,...u_n) \in M$$
 then

$$M := M \cup \{t_1 = u_1, ...t_n = u_n\} - \{f(t_1, ...t_n) = f(u_1, ...u_n)\};$$

if 
$$f(t_1,...t_n) = g(u_1,...u_n) \in M$$
 then return FAIL;

if 
$$x = x \in M$$
 then  $M := M - \{x = x\}$ ;

if 
$$x = t' \in M$$
 or  $t' = x \in M$  then

if 
$$x \in FV(t')$$
 then return  $FAIL$ ;

#
