Topic 8.1

Completeness

## Completeness

Now let us ask the daunting question!!!!!

Is resolution proof system complete?

In other words,

if  $\Sigma$  is unsatisfiable, are we guaranteed to derive  $\Sigma \vdash \bot$  via resolution?

We need a notion of not able to derive something.

# Clauses derivable with proofs of depth n

We define the set  $Res^n(\Sigma)$  of clauses that are derivable via resolution proofs of at most depth n from the set of clauses  $\Sigma$ .

#### Definition 8.1

Let  $\Sigma$  be a set of clauses.

$$Res^{0}(\Sigma) \triangleq \Sigma$$
  
 $Res^{n+1}(\Sigma) \triangleq Res^{n}(\Sigma) \cup \{C | C \text{ is a resolvent of clauses } C_{1}, C_{2} \in Res^{n}(\Sigma)\}$ 

### Example 8.1

Let  $\Sigma = \{(p \lor q), (\neg p \lor q), (\neg q \lor r), \neg r\}.$ Res<sup>0</sup>( $\Sigma$ ) =  $\Sigma$ 

$$Res^{1}(\Sigma) = \Sigma \cup \{q, p \lor r, \neg p \lor r, \neg q\}$$
  

$$Res^{2}(\Sigma) = Res^{1}(\Sigma) \cup \{r, q \lor r, p, \neg p, \bot\}$$

## All derivable clauses

 $Res^n(\Sigma)$  may saturate at some time point.

#### Definition 8.2

Let  $\Sigma$  be a set of clauses. There may be some m such that

$$Res^{k+1}(\Sigma) = Res^k(\Sigma).$$

Let 
$$Res^*(\Sigma) \triangleq Res^k(\Sigma)$$
.

If  $\Sigma$  is finite then k certainly exists.

## Completeness

#### Theorem 8.1

If a finite set of clauses  $\Sigma$  is unsatisfiable,  $\bot \in Res^*(\Sigma)$ .

#### Proof.

We prove the theorem using induction over number of variables in  $\Sigma$ .

Wlog, We assume that there are no tautology clauses in  $\Sigma_{\text{(why?)}}$ 

#### base case:

 $\Sigma$  has no variables.

Since we assume  $\Sigma$  is unsat,  $\Sigma = \{\bot\}_{\text{(why?)}}$ .

Therefore,  $\bot \in Res^*(\Sigma)$ .

..

# Completeness (contd.)

### Proof(contd.)

#### induction step:

Assume: theorem holds for all the formulas containing variables  $p_1, \dots, p_n$ .

Consider an unsatisfiable set  $\Sigma$  of clauses containing variables  $p_1, \dots, p_n, p_n$ 

#### Let

- $\triangleright$   $\Sigma_0 \triangleq$  the set of clauses from  $\Sigma$  that have p.
- $\triangleright \Sigma_1 \triangleq \text{be the set of clauses from } \Sigma \text{ that have } \neg p.$
- $\Sigma_* \triangleq$  be the set of clauses from  $\Sigma$  that have neither p nor  $\neg p$ .

#### Furthermore, let

$$\triangleright \Sigma_0' \triangleq \{C - \{p\} | C \in \Sigma_0\}$$

$$\triangleright \ \Sigma_1' \triangleq \{C - \{\neg p\} | C \in \Sigma_1\}$$

$$\Sigma = \Sigma_0 \wedge \Sigma_1 \wedge \Sigma_*$$

Exercise 8.1

@(F)(S)(D)

Show  $\Sigma_0' \models \Sigma_0$  and  $\Sigma_1' \models \Sigma_1$ 

## Example: projections

#### Example 8.2

Consider 
$$\Sigma = \{p_1 \lor p, p_2, \neg p_1 \lor \neg p_2 \lor p, \neg p_2 \lor \neg p\}$$

$$\Sigma_0 = \{ p_1 \lor p, \neg p_1 \lor \neg p_2 \lor p \}$$

$$\Sigma_1 = \{ \neg p_2 \lor \neg p \}$$

$$\Sigma_* = \{ p_2 \}$$

$$\Sigma'_0 = \{p_1, \neg p_1 \lor \neg p_2\}$$
  
 $\Sigma'_1 = \{\neg p_2\}$ 

Let us get familiar with an important formula:

 $(\Sigma_0' \wedge \Sigma_*) \vee (\Sigma_1' \wedge \Sigma_*) = \{p_1, \neg p_1 \vee \neg p_2, p_2\} \vee \{\neg p_2, p_2\}$ 

## Completeness (contd.)

## Proof(contd.)

Now consider formula

$$\underbrace{\left(\sum_0' \wedge \sum_*\right) \vee \left(\sum_1' \wedge \sum_*\right)}_{\text{p is not in the formula}}$$

**claim:** If  $(\Sigma'_0 \wedge \Sigma_*) \vee (\Sigma'_1 \wedge \Sigma_*)$  is sat then  $\Sigma$  is sat.

- Assume for some m,  $m \models (\Sigma'_0 \land \Sigma_*) \lor (\Sigma'_1 \land \Sigma_*)$ .
- ► Therefore,  $m \models \Sigma_{*,(why?)}$
- ightharpoonup Case 1:  $m \models (\Sigma_1' \wedge \Sigma_*)$ .

Since all the clauses of  $\Sigma_0$  have p,  $m[p \mapsto 1] \models \Sigma_{0(\text{why?})}$ . Since  $\Sigma_1'$  and  $\Sigma_*$  have no p,  $m[p \mapsto 1] \models \Sigma_1'$  and  $m[p \mapsto 1] \models \Sigma_*$ .

Since  $\Sigma_1' \models \Sigma_1$ ,  $m[p \mapsto 1] \models \Sigma_1$ .

- ▶ Case 2:  $m \models (\Sigma'_0 \land \Sigma_*)$ . Symmetrically,  $m[p \mapsto 0] \models \Sigma_0 \land \Sigma_1 \land \Sigma_*$ .
- ▶ Therefore,  $\Sigma_0 \wedge \Sigma_1 \wedge \Sigma_*$  is sat.

Exercise 8.2 Show  $\Sigma$  and  $(\Sigma_0' \wedge \Sigma_*) \vee (\Sigma_1' \wedge \Sigma_*)$  are equivalent.

# Completeness (contd.)

## Proof(contd.)

Since  $\Sigma$  is unsat,  $(\Sigma'_0 \wedge \Sigma_*) \vee (\Sigma'_1 \wedge \Sigma_*)$  is unsat.

Now we apply the induction hypothesis.

Since  $(\Sigma_0' \wedge \Sigma_*) \vee (\Sigma_1' \wedge \Sigma_*)$  is unsat and has no p,  $\bot \in Res^*(\Sigma_0' \wedge \Sigma_*)$  and  $\bot \in Res^*(\Sigma_1' \wedge \Sigma_*)$ .

Choose a derivation of  $\perp$  from both. Now there are two cases.

Case 1:  $\perp$  was derived using only clauses from  $\Sigma_*$  in any of the two proofs.

Therefore,  $\bot \in Res^*(\Sigma_*)$ . Therefore,  $\bot \in Res^*(\Sigma_0 \wedge \Sigma_1 \wedge \Sigma_*)$ .

Case 2: In both the derivations  $\Sigma'_0$  are  $\Sigma'_1$  are involved respectively.

# Example: choosing derivations

### Example 8.3

Recall our example 
$$\Sigma_*=\{\textit{p}_2\},\,\Sigma_0'=\{\textit{p}_1,\neg\textit{p}_1\vee\neg\textit{p}_2\},\,\Sigma_1'=\{\neg\textit{p}_2\}.$$

Proofs for our running example

$$\begin{array}{c|cccc}
 & \neg p_1 & \neg p_2 \\
\hline
 & \neg p_2 & p_2 \\
\hline
 & \bot & & \\
\hline
\end{array}$$

The above proofs belong to the case 2.

The above proofs do not start from clauses that are from  $\Sigma$ . So we cannot use them immediately. We need a construction.

# Completeness (contd.)

#### Proof(contd.)

Case 2: In both the derivations  $\Sigma'_0$  are  $\Sigma'_1$  are involved respectively.(contd.)

Therefore,  $p \in Res^*(\Sigma_0 \wedge \Sigma_*)$  and  $\neg p \in Res^*(\Sigma_1 \wedge \Sigma_*)$ .(why?)[needs thinking; look at the example to understand.] Therefore,  $\perp \in Res^*(\Sigma_0 \wedge \Sigma_1 \wedge \Sigma_*)_{(why?)}$ .

#### Example 8.4

Recall proofs.

$$\begin{array}{c|ccccc}
\hline
p_1 \lor p & \neg p_1 \lor \neg p_2 \lor p \\
\hline
\neg p_2 \lor p & p_2 \\
\hline
\bot \lor p & \bot \lor \neg p
\end{array}$$

# Exercise 8.3

Let F be an unsatisfiable CNF formula with n variables. Show that there is a resolution proof of  $\perp$ from F of size that is smaller than or equal to  $2^{n+1} - 1$ . Commentary: By inserting p in  $\Sigma_0'$  clauses of the left proof we obtain clauses of  $\Sigma_0$ . Therefore, the proof transforms into a proof from  $\Sigma_0 \wedge \Sigma_*$ . Since there are no  $\neg p$ 

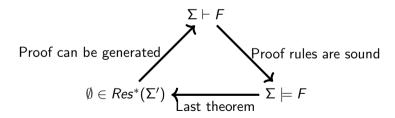

# Completeness so far

#### Theorem 8.2

Let  $\Sigma$  be a finite set of formulas and F be a formula. The following statements are equivalent.

- $\triangleright$   $\Sigma \vdash F$
- ▶  $\emptyset \in Res^*(\Sigma')$ , where  $\Sigma'$  is CNF of  $\bigwedge \Sigma \land \neg F$
- $\triangleright \Sigma \models F$

## Proof.

Exercise 8.4

How is the last theorem applicable here?

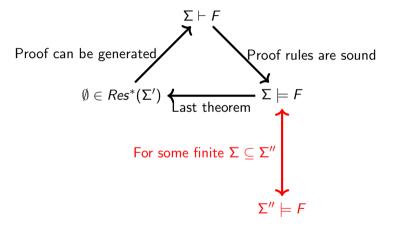

Topic 8.2

Finite to Infinite

## How do we handle $\Sigma'' \models F$ if $\Sigma''$ is an infinite set?

There is an interesting argument.

We prove that if an infinite set implies a formula, then a finite subset also implies the formula.

# A theorem on strings

**Commentary:** Theorem statement is a bit difficult to follow. We can draw parallel with real analysis, where we can say that a subset of words of S are approaching w but never reaching there. For example, series  $10^{-n}$  approaches 0.

### Theorem 8.3

Consider an infinite set S of finite binary strings. There exists an infinite string w such that the following holds.

$$\forall n. |\{w' \in S | w_n \text{ is prefix of } w'\}| = \infty$$

where  $w_n$  is prefix of w of length n.

## Proof.

We inductively construct w, and we will keep shrinking S. Initially  $w := \epsilon$ .

Commentary:  $\epsilon$  is the empty string.

#### base case:

w is prefix of all strings in S.

# A theorem on strings (contd.)

## Proof(contd.)

## induction step:

Let us suppose we have w of length n and w is prefix of all strings in S.

- ▶ Let  $S_0 := \{u \in S | u \text{ has } 0 \text{ at } n+1th \text{ position}\}.$
- ▶ Let  $S_1 := \{u \in S | u \text{ has } 1 \text{ at } n + 1th \text{ position}\}.$
- $\blacktriangleright \text{ Let } S_{\epsilon} := S \cap \{\mathbf{w}\}.$

Clearly, 
$$S = S_{\epsilon} \cup S_0 \cup S_1$$
. Either  $S_0$  or  $S_1$  is infinite.(why?)

If  $S_0$  is infinite, w := w0 and  $S := S_0$ . Otherwise, w := w1 and  $S := S_1$ .

w of length n+1 is prefix of all strings in the shrunk S.

Therefore, we can construct the required w.

#### Exercise 8.5

- a. Is the above construction of w practical?
- b. Construct infinite w for set S containing words of form 0\*1

## Compactness

#### Theorem 8.4

A set  $\Sigma$  of formulas is satisfiable iff every finite subset of  $\Sigma$  is satisfiable.

### Proof.

Forward direction is trivial.(why?)

#### Reverse direction:

We order formulas of  $\Sigma$  in some order, *i.e.*,  $\Sigma = \{F_1, F_2, \ldots\}$ .

Let  $\{p_1, p_2, ...\}$  be ordered list of variables from  $Vars(\Sigma)$  such that

- $\triangleright$  variables in **Vars**( $F_1$ ) followed by
- ▶ the variables in  $Vars(F_2) Vars(F_1)$ , and so on.

Due to the rhs, we have models  $m_n$  such that  $m_n \models \bigwedge_{i=1}^n F_i$ .

We need to construct a model m such that  $m \models \Sigma$ . Let us do it!

# Compactness (contd.) II

## Proof(contd.)

We assume  $m_n : \mathbf{Vars}(\bigwedge_{i=1}^n F_i) \to \mathcal{B}$ .

Commentary: Notation alert: we assumed our models assign values to all variables. Here we are defining a different object that maps only finitely many variables

We may see  $m_n$  as finite binary strings, since variables are ordered  $p_1, p_2, ...$  and  $m_n$  is assigning values to some first k variables.

Let  $S = \{m_n \text{ as a string } | n > 0\}$ 

Due to the previous theorem, there is an infinite binary string m such that each prefix of m is prefix of infinitely many strings in S.

# Example: some $m_n$ may not be a prefix of m

## Example 8.5

Consider 
$$\Sigma = \{p \lor q, \neg p \land r, \dots\}$$

Let 
$$m_1 = \{p \mapsto 1, q \mapsto 0\}$$

Let 
$$m_2 = \{p \mapsto 0, q \mapsto 1, r \mapsto 1\}$$

Note that  $m_1 \not\models \neg p \land r$ . Therefore,  $m_1$  will not be prefix of any  $m_n$  and consequently not prefix of m.

#### Exercise 8.6

Give an example of  $\Sigma$ ,  $m_n s$ , and m following the construction of previous slide such that no  $m_n$  is prefix of m?

# Compactness (contd.) III

## Proof(contd.)

**claim:** if we interpret m as a model(how?), then  $m \models \Sigma$ .

- ightharpoonup Consider a formula  $F_n \in \Sigma$ .
- ▶ Let k be the number of variables appearing in  $\bigwedge_{i=1}^n F_i$ .
- Let m' be the prefix of length k of m.
- ▶ There must be  $m_i \in S$ , such that m' is prefix of  $m_i$  and i > n. (why?)
- $\blacktriangleright$  Since  $m_i \models \bigwedge_{i=1}^j F_i$ ,  $m_i \models F_n$ .
- ▶ Therefore,  $m' \models F_n$ .
- ▶ Therefore,  $m \models F_n$ .

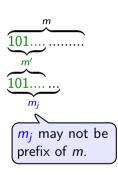

# Our Goal!

### Exercise 8.7

@(P)(S)(9)

Using the above theorem prove that if  $\Sigma'' \models F$  then there is a finite  $\Sigma \subseteq \Sigma''$  such that  $\Sigma \models F$ .

Commentary: m' may not be  $m_0$  as in the example 8.5. The theorem is about showing that even if  $m_0$  is not there, there is some other model that satisfies  $F_{0,0}$ Furthermore, m; may also be not a prefix of m. Surprised! Georg Cantor lost his mind thinking about  $\infty$ . Lookout for BBC documentary Dangerous Knowledge.

Topic 8.3

**Problems** 

## Slim proofs

For an unsatisfiable CNF formula F, a resolution proof R is a sequence of clauses such that:

- ightharpoonup Each clause in R is either from F or derived by resolution from the earlier clauses in R.
- ▶ The last clause in R is  $\bot$ .

### Consider the following definitions

- ▶ For a clause C and literal  $\ell$ , let  $C|_{\ell} \triangleq \begin{cases} \top & \ell \in C \\ C \{\overline{\ell}\} & \text{otherwise.} \end{cases}$
- ▶ Let  $F|_{\ell} \triangleq \bigwedge_{C \in F} C|_{\ell}$ .
- Let width(R) and width(F) be the length of the longest clause in R and F, respectively.
- ▶ Let  $slimest(F) \triangleq min(\{width(R)|R \text{ is resolution proof of unsatisfiability of } F\})$ .

#### Exercise 8.8

Prove the following facts.

- 1. if  $F|_{\ell}$  has an unsatisfiability proof, then  $F \wedge \ell$  has an unsatisfiability proof.
- 2. if  $k \ge width(F)$ , slimest $(F|_{\ell}) \le k 1$ , and slimest $(F|_{\ell}) \le k$  then slimest $(F) \le k$ .

# Exercise: connect finite and infinite (midterm 2021)

#### Exercise 8.9

Consider an infinite set *S* of finite binary strings. Prove/disprove: For each infinite binary string *w* the following holds.

$$\forall n. |\{w' \in S | w_n \text{ is prefix of } w'\}| > 0 \quad \text{iff} \quad \forall n. |\{w' \in S | w_n \text{ is prefix of } w'\}| = \infty$$

where  $w_n$  is prefix of w of length n.

## Topic 8.4

Extra slides: proofs are semi-decidable

Implication is decidable for finite lhs.

#### Theorem 8.5

If  $\Sigma$  is a finite set of formulas, then  $\Sigma \models F$  is decidable.

## Proof.

Due to truth tables.

# Two definitions: effectively enumerable and semi-decidable

#### Definition 8.3

If we can enumerate a set using an algorithm, then it is called effectively enumerable.

## Example 8.6

- The set of all programs is effectively enumerable, since they are finite strings that can be parsed.
- ▶ The set of all terminating programs is not effectively enumerable.

#### Definition 8.4

A yes/no problem is semi-decidable, if we have an algorithm for only one side of the problem.

# Implication is semi-decidable

#### Theorem 8.6

If  $\Sigma$  is effectively enumerable, then  $\Sigma \models F$  is at least semi-decidable.

## Proof.

Due to compactness if  $\Sigma \models F$ , there is a finite set  $\Sigma_0 \subseteq \Sigma$  such that  $\Sigma_0 \models F$ .

Since  $\Sigma$  is effectively enumerable, let  $G_1, G_2, \ldots$  be the enumeration of  $\Sigma$ .

Let  $S_n \triangleq \{G_1, \ldots, G_n\}$ .

There must be a  $S_{\nu} \supset \Sigma_{\Omega(whv?)}$ .

Therefore,  $S_k \models F$ .

We may enumerate  $S_n$  and check  $S_n \models F$ , which is decidable.

Therefore, eventually we will say yes if  $\Sigma \models F$ .

# End of Lecture 8
