Inside the solver

Ashutosh Gupta

IITB India

Compile date: 2024-03-06

Topic 1.1

Supporting tools

Tools

Let us install a few tools.

- linux
- emacs
- 🕨 git
- python3
- ▶ g++
- make
- ► gdb
- ▶ Eclipse for C++ (Eclipse installer asks for the choice of installation.)
- z3 source https://github.com/Z3Prover/z3
 - compile in debug and trace mode

Please follow these commands to compile z3 in debug mode

```
wget https://github.com/Z3Prover/z3/archive/refs/tags/z3-4.12.5.tar.gz
tar -xvzf z3-4.12.5.tar.gz
cd z3-z3-4.12.5
mkdir -p build
cd build
cmake -G "Unix Makefiles" -DCMAKE_BUILD_TYPE=Debug ../
make
```

Get the input test files from the course website and put in ~/eclipse-workspace/z3-build

- We need to learn to use an IDE and a debugger before start looking inside Z3
- Here, we will use VS Code and gdb on linux.
- You may choose any other IDE and debugger combination.

Setting VS code for Z3 ► start VS code from Z3 folder

```
<mark>cd</mark> ..
code .
```

Press E5

- Go to Extensions (blocky icon in left). Search C/C++ debugger extension and add the extension
- Go to Run > Add configurations > C/C++ :(gdb) attach, which creates launch.json. Please paste the following content in the launch.json

```
{
    "version": "0.2.0",
    "configurations": [
        {
            "type": "cppdbg",
            "request": "launch",
            "name": "Launch Program",
            "program": "${workspaceFolder}/build/z3",
            "cwd": "${workspaceFolder}",
            "args":["./class.smt2"]
        }
    ]
}
```

Download class.py and save in the z3-z3-4.12.5 folder

wget https://www.cse.iitb.ac.in/~akg/courses/2021-ar/class.smt2

Debugging using VS code

Some commands in gdb

- ► F5 runs the program in debug mode
- Inserting breakpoints
 - ▶ Navigate to source in left pane Project-explorer \rightarrow Source directory
 - By double clicking on left of source line number
- F11 // steps in the program
 F10 // steps over the function calls
 Shift-F11 // finish current function
 F5 // continue to next breakpoint
 code // executes the code written in Debgug Console

Topic 1.2

Engineering for CDCL(T)

Engineering CDCL(T)

Now we will look into the internals of Z3.

Key ideas to learn in implementation design

- term management in Z3
- tactics layer
- CDCL implementation
- base theory(QF_EUF) implementation

Key ideas to learn in software design

- be comfortable with large code base
- memory management
- customized library support

CDCL(T) architecture

Running Z3 in emacs gdb

 Consider the following SMT problem in *class.smt*2 (declare-sort U 0) (declare-fun f (U) U) (declare-const a U)

```
(assert (or (= (f(f a)) a) (= (f(f(f(f a)))) a) )
(assert (or (= (f(f(f a))) a) (= (f a) (f(f a)) ) )
(assert (not (= (f a) a) ) )
```

(check-sat)

Exercise 1.1

a. Is the above sat?

b. Run z3 with the above input by pressing F11 and then F8

Start of solving: setup_and_check

- setup_and_check is entry the point of SMT solver
- Some simplification are applied to the input before reaching here

Look at [Source directory]/src/smt/smt_context.cpp:3550

Exercise 1.2

- a. place a breakpoint there and rerun the binary till the breakpoint.
- b. Go to debugger console in the bottom pane and give command

display(std::cerr)

c. Observe callstack, explain the 20+ long call stack before start solving

Internalize

- Every atom gets a Boolean variable
- Every term gets an enode (nodes for equality reasoning)

Exercise 1.3

a. Go to debugger console in the bottom pane and give command

p display(std::cerr)

- b. Identify the number of declared enodes and their types
- c. Identify boolean encoder variables and their corresponding terms

Allocating enode

We need variable-sized enode to store pointer to arguments

- 1. Allocated a big chunk of memory
- 2. Declare initial part to be enode
- 3. Keep a pointer at the end of enode
- 4. Allocate extra space for the argument pointers
- 5. Access the rest of the space in the chunk via array access

	 	-	-	-	-	-	-	 -	-	-	-	-	-					-	-	-	-				-			-	-	-				-		-	Ξ.	-	_	-	-	-				-
Γ												_														<u> </u>												T							1	
																								. Г	~1					r-	11					Г	\sim	É.					. г	<u>_1</u>		
										e	۱Ľ	0	d	е						n	า_	ar	g	s	υı	m	i_2	ar	gs	51.	LI	m	_ć	ir	gs	51.	2	In	n.	_ć	ar	g	SI.	31	1	
												-	-	-									0							Γ.	- 13					Ľ		٩.				0				
L									_			_														I												1.								
_	 -	-						 -							-	_	-	-					-	-			_	-				_	_												_	

For details look at

- src/smt/smt_enode.h:121
- src/smt/smt_enode.h:158
- src/smt/smt_enode.cpp:68

CDCL - search

- propagates
- decides
- pushes to the theory base theory is implemented within the file

Look at at z3/src/smt/smt_context.cpp:3869

- a. Place a breakpoint there and go there
- a. find the function for Boolean propagation
- b. find the function for variable decisions
- c. find the function for push in the theory of equality

Boolean propagation

Uses watched literals for unit propagation

Look at z3/src/smt/smt_context.cpp:1707 z3/src/smt/smt_context.cpp:342

- Find where watched literal is implemented
- What are the special cases depending on the type of the clauses?
- Where propagated atoms are passed to equality engine?

Maintains a priority queue

Look at at z3/src/smt/smt_context.cpp:1817

- a. Find which data structure contains the the priority queue?
- b. How priority is managed?

Equality propagation

Equivalence classes are stored as circular linked lists over endoes

- Parents of classes are "exogenously" stored at the root
- Congruence table is used to find quick matches

Look at at z3/src/smt/smt_context.cpp:492

Exercise 1.7

find the place where

- a. classes are merged
- b. congruence on the parents are applied

Congruence

- Iterates over parents of the looser root
- Copies the parents to the winner
- Identifies new congruences and propagate them

Look at at z3/src/smt/smt_context.cpp:675

- a. find the place where the new congruences are identified
- b. Explain the mechanism

Clause learning

- Clause learning learns clauses from the conflict
- Adds new clauses in the
- Look at at z3/src/smt/smt_context.cpp:3650
 - ► Where conflicts are resolved?
 - What is the state after the conflict analysis?

Topic 1.3

Problems

Problem

Exercise 1.9 (2.5 points)

Read Z3 code for maintenance of parent relation in EUF solving. Write a short explanation of optimizations implemented to achieve efficient operations on the parent relation.

Files of interest are:

- z3/src/smt/smt_enode.cpp // class for nodes in union-find
- z3/src/smt/smt_enode.h
- z3/src/smt/smt_cg_table.cpp // class for parent relation
- z3/src/smt/smt_cg_table.h
- z3/src/smt/smt_context.cpp // class for smt solver
- z3/src/smt/smt_context.h
- z3/src/smt/smt_internalizer.cpp:902
- z3/src/smt/smt_internalizer.cpp:968

SMT solving begins at z3/src/smt/smt_context.cpp:3100

context object in smt_context.h has many display functions. Use them to print current state during

End of Lecture 1
