Thesis Definition

Develop a cheap and reliable sensor network application to monitor the bearing vibration of induction motors in a ship

Thesis Goals

- Find a suitable vibration sensor
- Form a network of sensor nodes
- Ensure reliable transfer of data
- Storage of measured readings on the node
- Conserve the battery power
- Process the measured signal and capture relevant vibration data

Existing Methods

Manual Methods

00000

Automatic/semi-automatic Methods

Shock Pulse Measurement

・ロ・ ・ 四・ ・ 回・ ・ 日・

- Vibration measurement
- Stator Transient current analysis

Introduction	Background ○○●○○	Related Work	Design Overview	Implementation	Performance	Future Work
Necessity of A	utomated Systen	า				

Drawbacks of Manual Methods

- Large number of machinery
- Hidden costs
 - More man hours expended
 - No lead time
 - Book keeping
 - Costly Hand held scopes

Introduction	Background ○○○●○	Related Work	Design Overview	Implementation	Performance	Future Work
Proposed Solu	ıtion					

Proposed Solution

- Develop a network of Wireless Sensor Nodes
- Should measure the vibrations automatically

Theory of Bearing Measurement

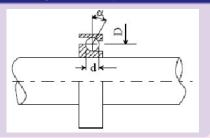

00000

Theory of Bearing Measurement

Outer, inner and ball race defects

$$\begin{bmatrix} F_{ord} = \left\{ \frac{N \cdot RPM}{2} \right\} \times \left\{ 1 - \left(\frac{d_{ball}}{D_{plitch}} \right) \times \cos\alpha \right\} \end{bmatrix}$$
$$\begin{bmatrix} F_{ird} = \left\{ \frac{N \cdot RPM}{2} \right\} \times \left\{ 1 + \left(\frac{d_{ball}}{D_{plitch}} \right) \times \cos\alpha \right\} \end{bmatrix}$$
$$F_{ball} = \left\{ \frac{RPM}{2} \right\} \times \left\{ \left(\frac{D_{plitch}}{d_{ball}} \right) - \left(\frac{d_{ball}}{D_{plitch}} \right) \times (\cos\alpha)^2 \right\}$$

Operation Cyc	le of Motors					
Desigr	n Overv	iew				

Operaton Cycle of Motors

- Important Fire fighting system, AC Plant , Ref plant etc.
- Less Important Cooling motors, Fuel supply motors for Engines
- Unimportant Ventilation, Sewage Motors

・ロ・ ・ 四・ ・ 回・ ・ 回・

Introduction	Background	Related Work	Design Overview ○●○○○○○	Implementation	Performance	Future Work
Operation Cyc	le of Motors					

Duty Cycle

- Motors are run in a cycle of 6 hours on/off in a day
- Nodes may wakeup once in every four hours and check for activity
- One measurement in a day is sufficient
- Latency upto one day is acceptable

Vibration Meas	urements					

Measurement Settings

- Sampling Frequency = 20KHz
- No of data points measured = 4096

•
$$\delta F = \frac{1}{(\delta T \times N)}$$

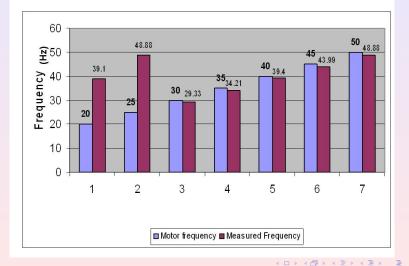

- δF is the desired frequency resolution
- δT is the time between two samples(depends on the sampling rate)

•
$$\delta F = \frac{1}{(50 \times 10^{-6} \times 4096)} = 4.88 Hz$$

- No of Frequencies checked = 7
- No of measurements obtained at each frequency = 5

A (1) > A (2) > A (2) > A

VMD Jagannath

Introduction	Background	Related Work	Design Overview	Implementation	Performance	Future Work

Future Work

- Data Compression
- Packaging
- Industry Trials
- Site Survey
- Security
- Low power operation (switch off Microcontroller)
- User Interface

Introduction	Background	Related Work	Design Overview	Implementation	Performance	Future Work

Conclusion

- Wireless solutions are ideal to ships environment
- Extendable to other equipment like Engines and Generators etc
