# Proof Procedure

## Possible Answers

Satisfiable

Tautology

Contradiction

...

Don't know!

Doesn't Stop?

# Decision Procedure

- A Proof procedure is a **Decision Procedure** (Algorithm) if it always **halts** with an answer in finite time.

- **Soundness**

A proof procedure is *sound* if it never gives a wrong answer.

For Propositional Logic there are many sound decision procedures.

- Truth Table.
- Semantic Methods (Gentzen)
  - Natural Deduction
  - Sequent Calculus
- Syntactic Methods
  - Hilbert's Proof System
  - Simplification (Boolean Ring)
  - Resolution Theorem Proving
  - Binary Decision Diagrams (BDD)

Why so many methods? **Efficiency**.

# Completeness

For some logics (we'll see later), it is not possible to give decision procedures.

That is, every theorem prover that is sound, will not halt on some inputs! (*a very non-intuitive and hard result to prove.*)

**Completeness** of a proof procedure is a weaker notion than termination.

Informal Definition

- A proof procedure is complete, if whenever the input is satisfiable, it answers correctly that it is satisfiable.

(Note: Nothing implied about behaviour when input is a contradiction).

This leads to the notion of a **semi-decision** procedure.

[Home Page](#)[Title Page](#)[Contents](#)[◀](#)[▶](#)[◀](#)[▶](#)[Page 5 of 10](#)[Go Back](#)[Full Screen](#)[Close](#)[Quit](#)

# A Semi-Decision Procedure

A trivial example, to illustrate the concept.

**Input:** A polynomial  $P(x)$  (example:  $3x^3 + 2x - 5$ ).

**Problem:** Does the polynomial have positive integer root? (that is, is there  $x \geq 0$  such that  $P(x) = 0$ ?).

**Semidecision Procedure**

```
i = 0
repeat
  if P(i) = 0
    then print YES
    break
  else i = i + 1
end repeat
```

This method is **sound** and **complete**, but is not a **decision procedure**.

# Satan-Cantor Puzzle

Very interesting formulation (Raymond Smullyan).

# Satan-Cantor Variations

- Natural Numbers  $(0, 1, 2, 3 \dots)$
- Integers (Negative numbers also)
- Pairs  $(, \langle < 3, 8 > \rangle \langle < -4, 7 > \rangle)$
- Triples, Quadruples, ...
- N-tuple with N unknown, but finite.
- Real Numbers

Notions of

- Countable
- Fair Enumeration

are very useful in proof procedures (and logic programming)

# Booelan Ring Rewriting Method

Given a set  $R$  of rewriting rules, proceed as follows.

- Start with  $f$  as input formula  $f_0$
- Repeat
  - If  $f$  “simplifies” to  $f_1$  using  $R$ 
    - \* then let  $f = f_1$
    - \* else  $f$  is a normal form. Break
- If  $f = 0$  print “Contradiction”
  - elseif  $f = 1$  print “Tautology”
  - else print “Satisfiable”

# Boolean Ring Rules

$$\text{neg}(x) \rightarrow x + 1$$

$$x \vee y \rightarrow x + y + xy$$

$$x1 \rightarrow x$$

$$x0 \rightarrow 0$$

$$xx \rightarrow x$$

$$x + x \rightarrow 0$$

$$x + 0 \rightarrow x$$

$$x(y + z) \rightarrow xy + xz$$

$$(y + z)x \rightarrow yx + zx$$

Just like **polynomials** we work with in algebra.

# Associativity and Commutativity

Interesting properties (AC)

$$\begin{array}{lcl} x + y & \rightarrow & y + x \\ (x + y) + z & \rightarrow & x + (y + z) \\ xy & \rightarrow & yx \\ x(yz) & \rightarrow & (xy)z \end{array}$$

Can't use as rules. We will lose termination!

# Sample Problems Again

How to formulate and solve?

An island is inhabited by two classes of people: knights, who make only true statements, and knaves, who make only false statements. Three inhabitants are conversing. Ashok says, "All of us are knaves." Balu says, "Exactly one of us is a knight." What are Ashok, Balu, and Chandra?

Either the program never terminates or the value of  $n$  is eventually zero. If the value of  $n$  is eventually zero then the value of  $m$  will also eventually be zero. The program does terminate. Therefore the value of  $m$  will eventually be zero. (T: the program terminates; N: the value of  $n$  is zero; M: the value of  $m$  is zero.)
