## Plan for Lecture 20

- Domains, Interpretations, Models
- Examples

# Semantics of FOL

**Semantics** (or interpretation) assigns **truth values** to wffs.

An **interpretation** of a wff consists of

- A nonempty (**countable**) domain  $D$ .
- An assignment of values to each individuals (constants and free variables), function and predicate symbols occurring in the formula as follows:
  - To each constant and free variable, some element of  $D$  is assigned.
  - To each  $n$ -ary function symbol, a mapping from  $D^n \rightarrow D$  is assigned.
  - To each  $n$ -ary predicate symbol, an  $n$ -ary relation over  $D$  is defined.

# Truth over the Domain

Given such an interpretation, a wff is assigned a truth value as follows.

- Atomic Formulae ( $P(t_1, \dots, t_n)$ ) is looked up in the interpretation.
- If the subformulae  $G$  and  $H$  are assigned truth values then the truth values for the formulae  $\neg G$ ,  $(G \wedge H)$ ,  $(G \vee H)$ ,  $(G \rightarrow H)$ ,  $(G \leftrightarrow H)$  are evaluated using the truth tables (propositional logic) for these operators.
- $\forall X G$  has the truth value *true* iff  $G$  is evaluated to *true* for each  $d$  in  $D$ .
- $\exists X G$  has the truth value *true* iff  $G$  is evaluated to *true* for at least one  $d$  in  $D$ .

# Interpretations

More than one interpretation is possible for a formula which arise out of different choices of  $D$  and different interpretation of symbols over a given  $D$ .

$p(a)$

- Interpretation:  $D = \{1, 2\}$ .  
Assignment for  $a$  is 1.  
Assignment for  $p$  is  $p(1) = \text{true}$  and  $p(2) = \text{false}$ .  
Under this interpretation the given wff is true.
- Another Interpretation:  $D$  and  $p$  as before, but  $a$  is 2.  
The the wff is false under this interpretation.

$\forall X p(X)$  and  $\exists X p(X)$ :

- Under both the above interpretations, the first wff evaluates to false while the second one evaluates to true.
- Consider other interpretations:  
 $D = \{0, 1, 2, \dots\}$ ,  $p(X)$  is the relation  $X$  is odd.

# Yet Another Example

$\forall X p(X, f(X))$ :

- An interpretation that satisfies this formula is:  
Domain:  $D = \{0, 1, 2, \dots\}$ ,  
Function:  $f(X) = x + 1$ ,  
Predicate:  $p(X, Y)$  is true iff  $X \leq Y$ .
- Another interpretation (Herbrand Interpretation):  
Domain:  $D = \{a, f(a), f(f(a)), \dots\}$ ,  
Function:  $f(a) = f^1(a)$ ,  
 $f(f^n(a)) = f^{n+1}(a)$ .  
Predicate:  $p(X, Y)$  is true iff  
 $x = f^n(a), y = f^m(a)$  and  $n \leq m$ .

# Interesting Example

Consider the two formulae  $\forall X \exists Y p(X, Y)$  and  $\exists Y \forall X p(X, Y)$ . We have a number of interpretations possible for these formulae:

- Consider the interpretation:

$$D = \{0, 1, 2, \dots\}.$$

$$p(X, Y) \text{ is } X \geq Y.$$

Both the wff are true.

- Here is another interpretation:

$$D = \{\dots, -2, -1, 0, 1, 2, \dots\}.$$

$$p(X, Y) \text{ is as before.}$$

The first wff is true while the second one is false!

# Models

An interpretation of a wff is called its *model* if the wff is true under that interpretation. An interpretation of a wff is called its *counter-model* if the wff is false under that interpretation. A wff is *valid* provided it is true under *all* interpretations. Examples of valid formulae:

$$1. \forall X p(X) \rightarrow \exists X p(X).$$

$$2. \forall X p(X) \rightarrow p(a).$$

$$3. \exists Y \forall X p(X, Y) \rightarrow \forall X \exists Y p(X, Y).$$

$$4. \exists X p(X, X) \rightarrow \exists X \exists Y p(X, Y).$$

$$5. (\forall X p(X) \vee \forall X q(X)) \rightarrow \forall X p(X) \vee q(X).$$

$$6. \exists X (p(X) \wedge q(X)) \rightarrow \exists X p(X) \wedge \exists X q(X).$$

$$7. (\exists X p(X) \rightarrow \forall X q(X)) \rightarrow \forall X (p(X) \rightarrow q(X)).$$

[Home Page](#)[Title Page](#)[Contents](#)[Page 8 of 14](#)[Go Back](#)[Full Screen](#)[Close](#)[Quit](#)

# Examples of Invalid Formulae:

1.  $\exists X p(X) \rightarrow \forall X p(X)$ .

2.  $p(a) \rightarrow \forall X p(X)$ .

3.  $\forall X \exists Y p(X, Y) \rightarrow \exists Y \forall X p(X, Y)$ .

4.  $\exists X \exists Y p(X, Y) \rightarrow \exists X p(X, X)$ .

5.  $\forall X (p(X) \vee q(X)) \rightarrow (\forall X p(X) \vee \forall X q(X))$ .

6.  $\exists X p(X) \wedge \exists X q(X) \rightarrow \exists X (p(X) \wedge q(X))$

7.  $\forall X (p(X) \rightarrow q(X)) \rightarrow (\exists X p(X) \rightarrow \forall X q(X))$ .

[Home Page](#)[Title Page](#)[Contents](#)[Page 9 of 14](#)[Go Back](#)[Full Screen](#)[Close](#)[Quit](#)

# Satisfiability

- A wff is **satisfiable** provided it is true under some interpretation, i.e. there exists a model.

Note that all valid wffs are satisfiable, while some invalid ones are satisfiable.

- A wff is a **contradiction** or **unsatisfiable** if and only if it is false under all interpretations.

Therefore a negation of valid formula is unsatisfiable.

# Some Important Equivalences in FOL

- All PL equivalences hold in FOL.
- Duality of Quantifiers:
  - $\neg \forall X A(X) \leftrightarrow \exists X \neg A(X).$
  - $\neg \exists X A(X) \leftrightarrow \forall X \neg A(X).$
- Scope inclusion/exclusion rules: The following set of equivalences and their symmetric counterparts are all valid:
  - $\exists X A(X) \vee B \leftrightarrow \exists X (A(X) \vee B).$
  - $\forall X A(X) \vee B \leftrightarrow \forall X (A(X) \vee B).$
  - $\exists X A(X) \wedge B \leftrightarrow \exists X (A(X) \wedge B).$
  - $\forall X A(X) \wedge B \leftrightarrow \forall X (A(X) \wedge B).$

where  $X$  does not occur free in  $B$ .

# Encoding World-Knowledge

*Every man is mortal. Chanakya is a man. Therefore Chanakya is mortal.*

*Every IITian stays in the campus, and  
Ajay is an IITian.  
Hence, Ajay stays in the campus.*

*5 is a prime number and it is odd.  
Therefore, there exists an odd prime number.*

1.  $[\forall X(\text{man}(X) \rightarrow \text{mortal}(X)) \wedge \text{man}(\text{Chanakya})] \rightarrow \text{mortal}(\text{Chanakya}).$
2.  $[\forall X(\text{iitian}(X) \rightarrow \text{campusite}(X)) \wedge \text{iitian}(A)] \rightarrow \text{campusite}(A).$
3.  $\text{prime}(5) \wedge \text{odd}(5) \rightarrow \exists X(\text{prime}(X) \wedge \text{odd}(X)).$

# More Examples

- At least one hour is free.

$$\exists X \text{ freehour}(X).$$

- A thing is a pen only if it writes and holds ink.

$$\forall X (\text{write}(X) \wedge \text{ink}(X) \rightarrow \text{pen}(X))$$

- All that glitters is not gold

$$\neg(\forall X \text{glitter}(X) \rightarrow \text{gold}(X))$$

(Compare with:  $\forall X (\text{glitter}(X) \rightarrow \neg \text{gold}(X))$ )

Alternatively:  $\exists X (\text{glitter}(X) \wedge \neg \text{gold}(X))$

- For every positive number there is a smaller number.

$$\forall X \exists Y \text{gt}(X, Y)$$

# Validity of FOL formulae

The methods employed for determining validity of propositional formulae can not be directly extended.

- Truth table method of PL can not be extended as the truth table for FOL would require an infinite table!
- Normal Forms Method is also less effective since we can not have normal forms that can be syntactically checked to determine whether a wff is valid.

Normal forms are however, useful as they allow one to assume a fixed syntactic form for wffs. Two normal forms for FOL wffs are defined *Prenex Conjunctive Normal Form* and *Prenex Disjunctive Normal Form*.

[Home Page](#)[Title Page](#)[Contents](#)[Page 14 of 14](#)[Go Back](#)[Full Screen](#)[Close](#)[Quit](#)

# Prenex Normal Forms

A wff is in prenex conjunctive normal form (PCNF) if

- it is either  $T$  or  $F$  or
- it is of the form  $Q_1x_1 \cdots Q_nx_nM$ , where each  $Q_ix_i$  is either  $\forall x_i$  or  $\exists x_i$  and  $M$  is a wff containing no quantifiers and is in conjunctive normal forms.  $Q_1 \cdots Q_n$  is called *prefix* and  $M$  is called the *matrix*.

Examples of PCNF

- $\forall X \forall Y (p(X, Y) \wedge q(Y)).$
- $\forall X \exists Y (\neg p(X, Y) \vee q(X, Y)).$
- $\forall X \forall Y \exists Z ((\neg q(Y) \vee p(X, Y)) \wedge r(X, Z)).$

Exercise Design an algorithm for converting any wff to prenex normal form.
