

Advanced Tools from Modern Cryptography

Lecture 0

Manoj Prabhakaran

IIT Bombay

"Old" Cryptography

Scytale (ancient Greece)

Caesar Cipher

100 BC - 44 BC

801-873

Cryptanalysis (simple frequency analysis)
of Caesar cipher by Al-Kindi

“Old” Cryptography

“Human ingenuity cannot concoct a cypher
which human ingenuity cannot resolve”

–Edgar Allan Poe

1809-1849

From Art to Science

1916 - 2001

Information can be quantified

Perfect secrecy: ciphertext has zero information about the message

Key to perfect secrecy: Randomness

What is Modern Cryptography?

IT'S AN
ELEPHANT!

IT'S AN

Modern Cryptography

- Some tools

- Secure Multi-Party Computation (MPC)

- In particular, Zero-Knowledge Proofs

- Private Information Retrieval (PIR)

- Fully Homomorphic Encryption (FHE)

- Functional Encryption (FE)

- Obfuscation

- Searchable Encryption

- Oblivious RAM (ORAM)

- Leakage-Resilient tools

- Tools for what?

Collaboration

- ... Among mutually distrusting entities
- **Secure Multi-Party Computation**
 - Example: Company A is shopping for parts for its new product from a supplier, Company B.
 - Example: Auctions, where only the winners' payments need to be revealed
 - Example: Govt. agencies collaborating to enforce laws while respecting the privacy of citizens

Securing Cloud Storage

• Private Information Retrieval

- Don't want the server to see my access pattern

• Searchable Encryption

- Allow search operations on data stored encrypted on the server (OK to reveal the access pattern)

• Oblivious RAM

- Allow read and write operations on data stored on the server, and do not reveal access pattern

Computing on Encrypted Data

- Similar goals as achieved by MPC, but with very restricted interaction among parties (and weaker security guarantees)
- **Fully Homomorphic Encryption**: computing server does not see the data; client need not do the computation, but only encryption/decryption
- **Functional Encryption**: keys can be issued to allow computation of specific functions, with the outcome becoming available to the computing party
- **Obfuscation**: “Encrypted” function that can be run on any input (without needing a key)

Connections

- These are also often tools for building other cryptographic tools
 - e.g., ORAM can be used for MPC
 - e.g., MPC can be used for FE
 - e.g., MPC for leakage resilience
- They share some common underlying primitives
 - e.g., Secret-sharing, Randomized Encoding

Definitions

- Important to be precise about what these (complicated) tools actually guarantee
- Even for a simple tool like encryption, easy to misunderstand its guarantees
 - e.g., malleability, circular (in)security, ...
- Strong security definitions are often provably impossible to achieve for many of these tools
 - e.g., (standard) “universally composable” security for MPC, “virtual black box” security for obfuscation, etc.

Course Plan

- Focus on MPC & ZK Proofs
- Other topics as time permits
- Background needed: Mathematical maturity (reading definitions, writing proofs, ...), familiarity with probability, linear algebra, computational complexity

Course Logistics

• Grading:

- Two Quizzes (60%)
 - 2-3 HW assignments (20%)
 - Course project (20%)
 - > 80% attendance expected!
- “Theory” course: no programming requirement, but your course project could be a programming project
- Practical ZK tools available now. And we have an MPC programming language too!
- Office hours TBA. Announcements via Moodle
- Slides on course webpage: see cse.iitb.ac.in/~mp/teach/
