Advanced Tools from Modern Cryptography

Lecture 4
Secure Multi-Party Computation:
Passive Corruption + Honest-Majority

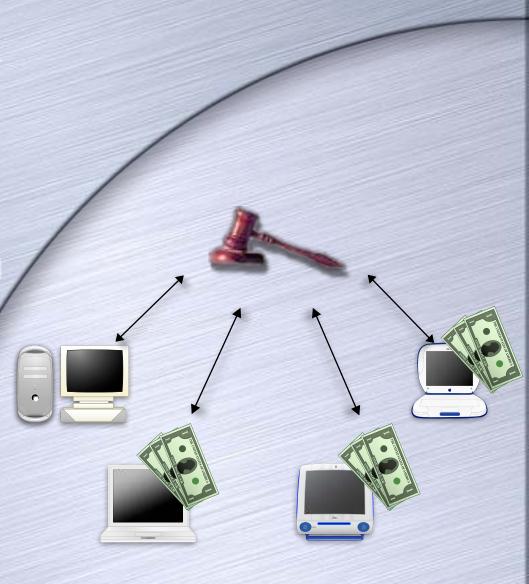

Must We Trust Company

Can we have an auction without an auctioneer?!

Declared winning bid should be correct

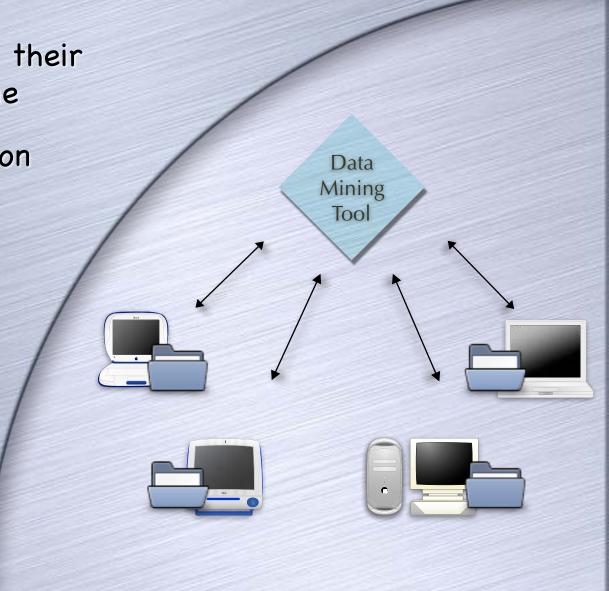

Only the winner and winning bid should be revealed

Using data without sharing?

• Hospitals which can't share their patient records with anyone

But want to data-mine on combined data

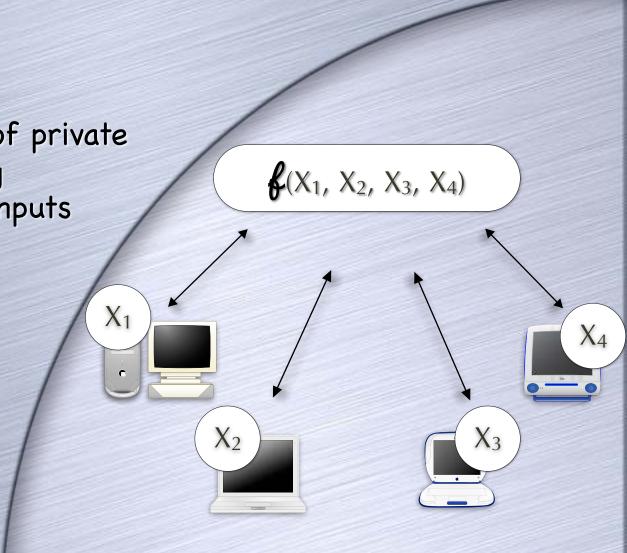

Secure Function Evaluation

A general problem

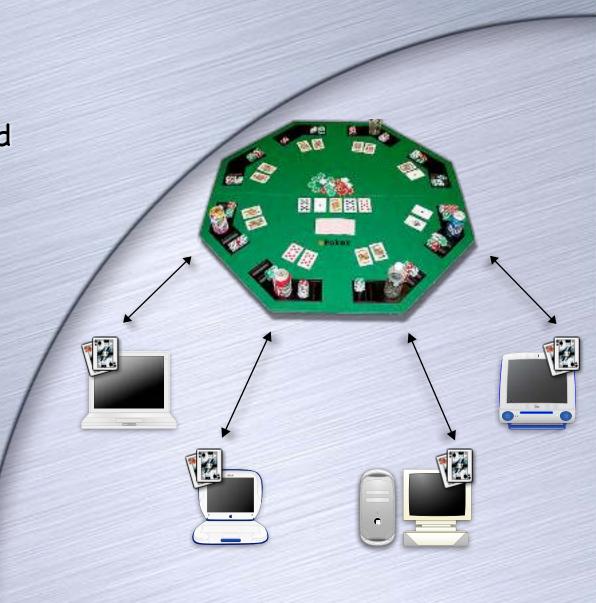

To compute a function of private inputs without revealing information about the inputs

Beyond what is revealed by the function

Poker With No Dealer?

- Need to ensure
 - Cards are shuffled and dealt correctly
 - O Complete secrecy
 - No "cheating" by players, even if they collude
- No universally trusted dealer

The Ambitious Goal

- Without any trusted party, securely do
 - Distributed Data mining
 - E-commerc
 - Network G
 - E-voting
 - Secure fun
 - **9**....

Secure
Multi-Party Computation
(MPC)

Mental Poker

Adi Shamir, Ronald L. Rivest and Leonard M. Adleman

Massachusetts Institute of Technology

MESTRACT

Can two potentially dislicated players play a fair game of poker without using any earls—for example, over the phone? This paper provides the following answers:

- No. (Rigorous mathematical proof supplied.) -
- Yes. (Corrers and complete protocol given.)

Emulating Trusted Computation

- Encryption/Authentication allow us to emulate a trusted channel
- Secure MPC: to emulate a source of trusted computation
 - Trusted means it will not "leak" a party's information to others
 - And it will not cheat in the computation
- A tool for mutually distrusting parties to collaborate

Is it for Real?

- Getting there! Many implementations/platforms
 - Fairplay, VIFF
 - Sharemind
 - SCAPI
 - Obliv-C
 - JustGarble
 - SPDZ/MASCOT
 - ObliVM
 - Ø ...
 - multipartycomputation.com/mpc-software

Is it for Real?

- And many practical systems using some form of MPC
 - Danish company Partisia with real-life deployments (since 2008)
 - sugar beet auction, electricity auction, spectrum auction, key management
 - A prototype for credit rating, supported by Danish banks
 - A proposal to the Estonian Tax & Customs Board
 - A proposal for Satellite Collision Analysis
 - Legislation in the US to use MPC for applications like a "higher education data system"

MPC

- Several dimensions
 - Passive (Semi-Honest) vs. Active corruption
 - Passive: corrupt parties still follow the protocol
 - Honest-Majority vs. Unrestricted corruption
 - Information-theoretic vs. Computational security
 - Ø ...

Security Definition

- Simplest case: Passive corruption, Information-theoretic security
 - Need honest-majority (or similar restriction)
- In passive corruption, the adversary can see the internals of all the corrupt parties, but cannot control their actions
 - Main concern will be secrecy (correctness is automatic, provided the protocol is corrupt in the absence of corruption)
 - Will ask for Perfect Secrecy
 - Similar to secret-sharing

Security Definition

- Multiple parties in a protocol could be corrupt
 - Collusion
 - Modelled using a single adversary who corrupts the parties
 - Its view contains all the corrupt parties' views
- Security guarantee given against an "adversary structure"
 - Sets of parties that could be corrupt together

Security Definition

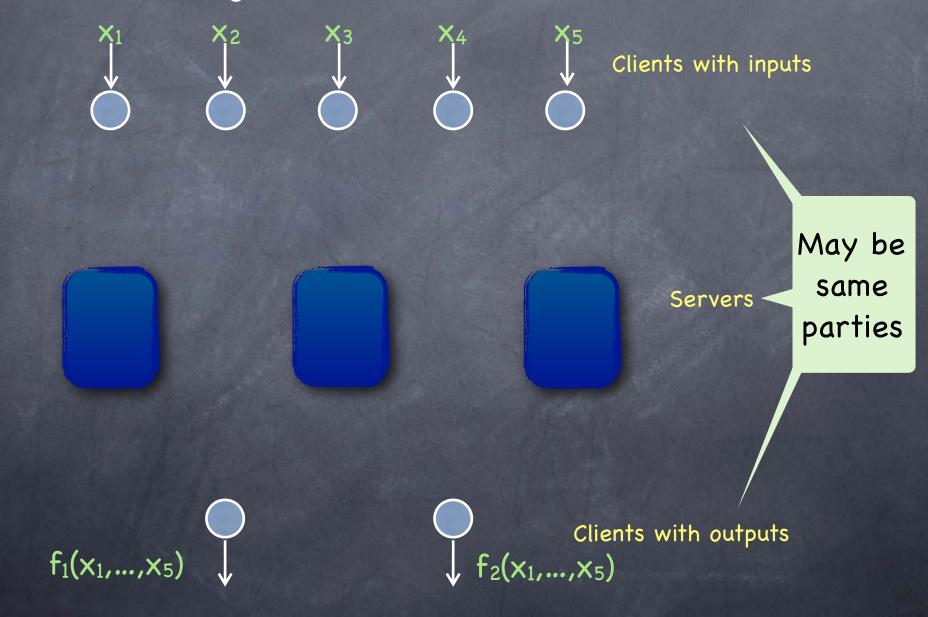

- For secret sharing we needed to formalise "x is secret"
- Now want to say: x is secret except for f(x) which is revealed
- $\forall x, x' \text{ s.t. } f(x)=f(x'), \{ \text{ view } | \text{ input}=x \} = \{ \text{ view } | \text{ input}=x' \}$

Information-Theoretic Passive-Secure MPC

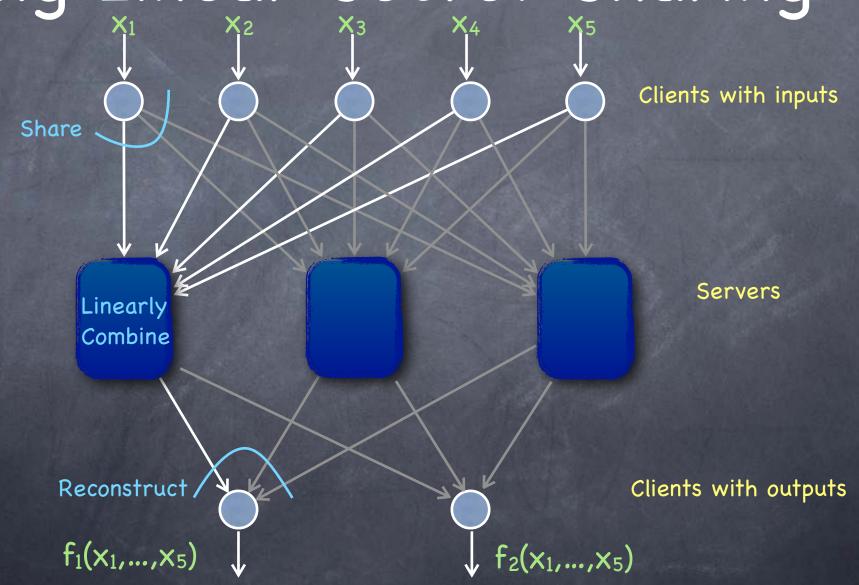

- Perfectly secure MPC against passive corruption
- Today: For linear functions
- Next time: For general functions

MPC for Linear Functions

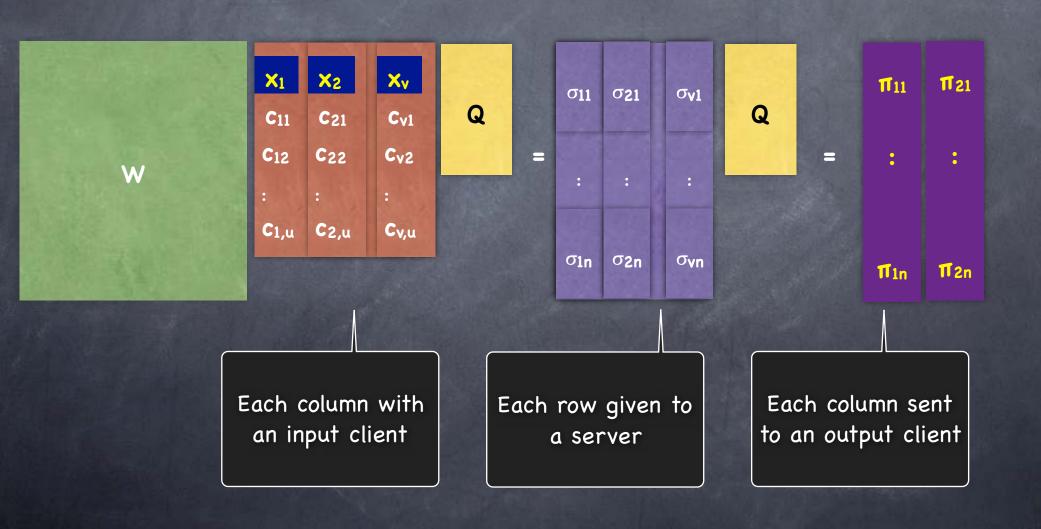

Client-server setting

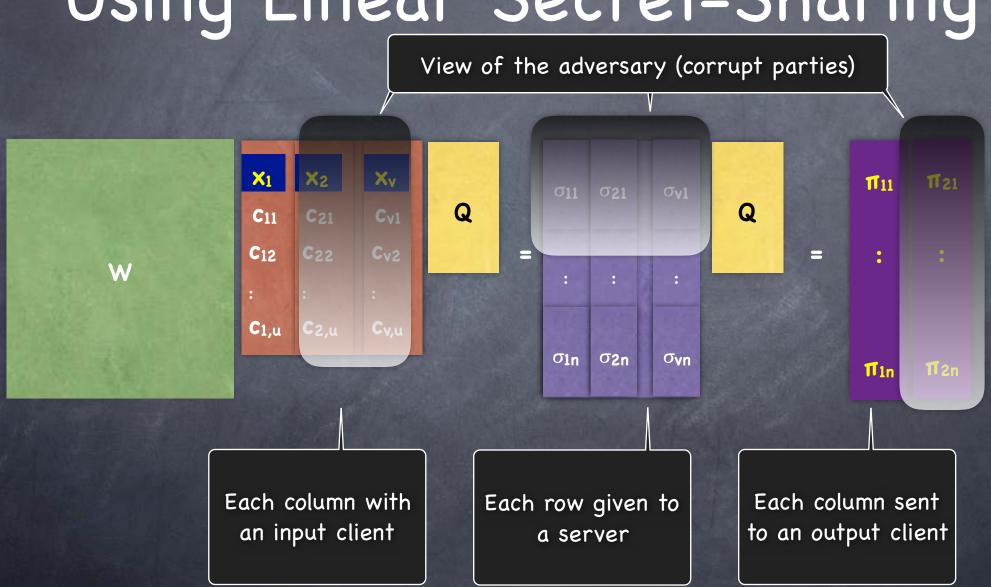

MPC for Linear Functions: Using Linear Secret-Sharing

MPC for Linear Functions: Using Linear Secret-Sharing

MPC for Linear Functions: Using Linear Secret-Sharing

Security

- Adversary allowed to corrupt any set of input and output clients and any subset T of servers s.t. T is not a privileged set (i.e., not in the access structure) for the secret-sharing scheme
- View of adversary should reveal nothing beyond the inputs and outputs of the corrupted clients
 - Claim: Consider any input y of corrupt clients. If x, x' of uncorrupted clients such that for each corrupt output client i f_i(x,y)=f_i(x',y), then the view of the adversary in the two cases are identically distributed
 - Because for any given view of the adversary, the solution space of randomness has the same dimension in the two cases
 - Exercise
