Problem Statement

Given a set of lecture notes (pdf files) or PDF of a textbook from a course-ware repository,

• Provide user with the reading material, suggest some Basic and Advanced Topics.

KeyWord T	hreads	Search
Subject O	perating Systems	
File Name	Pre-requisite Files	Follow-Up Files
Threads (Module 3)	* Process	* User Threads * Kernel Threads

A (10) N (10)

It is borrowed from philosophy - the study of "The nature of being".

It "consists of concepts, hierarchical organization of concepts".

Domain Ontology

- Model which provides definitions and relationships of the concepts, and major theories, principles and activities in the domain.
- Domain ontologies provide shared and common understanding of a specific domain.

・ ロ ト ・ 同 ト ・ 三 ト ・ 三 ト

Applications of Ontology

- Knowledge management: Acquiring, maintaining, and accessing an organization's data.
 - "What is the birthplace of Gandhi?"
- Web commerce: On-line market places and auction houses.
- **E-learning:** Dependencies between the keywords of a topic in the repository.

(日)

Keyword Extraction

A D N A B N A B N A B N

Tf-ldf

Tf-Idf⁶

Given a document collection D, a word w, and an individual document $d \in D$

$$w_d = f_{w,d} * log(|D|/f_{w,D})$$

$$Tf - Idfweight = \sum_{d=1}^{|D|} w_d$$

where

- $f_{w,d}$ Number of times w appears in the current document d,
- |D| Number of documents, and
- $f_{w,D}$ Number of documents in which w appears

⁶http://en.wikipedia.org/wiki/Tf%E2%80%93idf < □ > < 클 > < ≧ > < ≧ > = Neelamadhav Gantayat (IIT Bombay) Building domain ontology from lecture notes M Tech Project Presentation 24 / 44

Importance of Tf-ldf

- Highest when w occurs many times within a small number of documents:
- Lower when the term occurs fewer times in a document, or occurs in many documents;
- Lowest when the term occurs in virtually all documents.

く 伺 ト く ヨ ト く ヨ ト

Apriori Algorithm[5]

Apriori Algorithm is an algorithm for finding association rules.

- Find Keywords (Tf-idf weights)
- Find out the *frequent wordsets* with the given *support* and *confidence*, for all pairs of keywords.

Terminology

Association Rule $i \rightarrow j$ means "if a document contains *i* then it is likely to contain *j*".

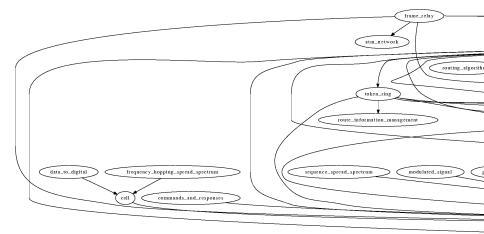

Support The number of documents containing the words in *w*.

Confidence of this association rule is the probability of j given i.

CRF-based NER [6]

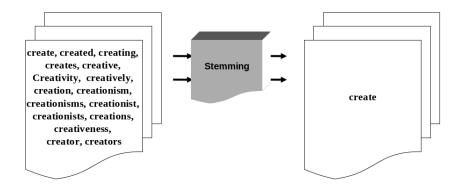

We used Stanford NER mainly because of the following reasons

- The NER is trained on CoNLL, MUC and ACE English training data
- By default it recognizes the entities: Person, Location, Organization, Which we need for our experiment
- Finally the NER is trained on both British and American newswire, so robust across both domains

<日

<</p>

Stemming [7]

イロト イポト イヨト イヨト

Ontology Development

- We modified our Apriori algorithm in order to get good results.
- We considered a line as a dataset instead of the whole document.

Recall & Precision

We have compared results generated by our system with those of the expert generated results.

Recall (R) Ratio of the relevant results retrieved to the results suggested by the expert.

$$R_w = \frac{W_c}{W_e} * 100\%$$
 $R_r = \frac{R_c}{R_e} * 100\%$

Precision (P) Ratio of the relevant results retrieved to the total results identified by the system.

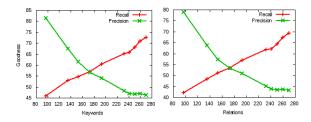

$$P_{pw} = \frac{W_c}{W_s} * 100\%$$
 $P_r = \frac{R_c}{R_s} * 100\%$

(4) (日本)

Future Work

- We observed that Recall was maximum when the number of keywords was nearly equivalent to 95.
- The optimum value of Recall was obtained when the number of unigrams was 40, number of bigrams was 30, number of trigrams was 20, and number of fourgrams was 10.
- Efficiency of the system is mainly dependent on number of PDF files in case of multiple PDF files.
- And dependent on number of pages in case of a single pdf file.
- Relationship identification and keyword extraction algorithms can be modified for better results.
