Lecture 14: Shading
Shading

- Assigning colour to pixels or fragments.
- Modelling Illumination
- We shall see how it is done in a rasterization model.
Shading

- Illumination Model: The Phong Model
  - For a single light source total illumination at any point is given by:
    \[ I = k_a I_a + k_d I_d + k_s I_s \]

  where
  - \( k_a I_a \) is the contribution due to ambient reflection
  - \( k_d I_d \) is the contribution due to diffuse reflection
  - \( k_s I_s \) is the contribution due to specular reflection
Shading

• Components of the Phong Model

• Ambient Illumination: $I_a$
  - Represents the reflection of all indirect illumination.
  - Has the same value everywhere.
  - Is an approximation to computing *Global Illumination*.

Shading

• Components of the Phong Model

• Diffuse Illumination: \( I_d = I_L \cos \theta_L \)
  - Assumes Ideal Diffuse Surface – that reflects light equally in all direction.
  - Surface is very rough at microscopic level. For e.g., Chalk and Clay.
Shading

- Components of the Phong Model
- Diffuse Illumination: \( I_d = I_L \cos \theta_L \)
  - Reflects light according to *Lambert's Cosine Law*

\[ \vec{L} : \text{vector to the light source} \]
\[ I_L : \text{intensity of the light source} \]
\[ \vec{N} : \text{surface normal} \]
Shading

- Components of the Phong Model

- Diffuse Illumination: \( I_d = I_L \cos \theta_L \)
  - Reflects light according to *Lambert's Cosine Law*

If \( \vec{L} \) and \( \vec{N} \) are in opposite directions then the dot product is negative. Use \( \max (\vec{L} \cdot \vec{N}, 0) \) to get the correct value.

If \( r \) is distance to the light source and \( I_t \) is its true intensity then a distance based attenuation can be modelled by an inverse square falloff, i.e., \( I_L = I_t / r^2 \)
Shading

• Components of the Phong Model

• Specular Illumination:  \( I_s = I_L \cos^n \alpha_v = I_L (\vec{R} \cdot \vec{V})^n \)
  - Ideal specular surface reflects only along one direction.
  - Reflected intensity is view dependent – Mostly it is along the reflected ray but as we move away some of the reflection is slightly offset from the reflected ray due to microscopic surface irregularites.
Shading

- Components of the Phong Model

- Specular Illumination: $I_s = I_L \cos^n \alpha_v = I_L (\vec{R} \cdot \vec{V})^n$
  - $n$ is called the coefficient of shininess and $I_L = I_t / r^2$
Shading

- The Phong Illumination Model

\[ I = k_a I_a + k_d I_d + k_s I_s \]

- \( k_a, k_d, k_s \) are material constants defining the amount of light that is reflected as ambient, diffuse and specular. They may be defined in as three values with R, G, B components.
Shading

- The Blinn-Phong Illumination Model

\[ \vec{H} = \frac{\vec{L} + \vec{V}}{||\vec{L} + \vec{V}||} \]

\[ I_s = I_L \cos^n \phi = I_L (\vec{H} \cdot \vec{N})^n \]

\[ \theta + \alpha_v = \phi + \gamma \]
\[ \theta + \phi = \gamma \]

\[ \rightarrow \alpha_v - \phi = \phi \quad \text{or} \quad \alpha_v = 2\phi \]
Shading

- Local Illumination Model

\[ I_{local} = k_a I_a + \sum_{1 \leq i \leq m} (k_d I_{di} + k_s I_{si}) \]

- Global Illumination Model

\[ I_{global} = I_{local} + k_r I_{reflected} + k_t I_{transmitted} \]
Shading

- Surface Material Properties
- Colour – For each object there can be a
  - Diffuse colour, Specular colour, Reflected colour and Transmitted colour
  - Remember differently coloured light is at different wavelength so:
    \[ I_\lambda = k_a C_d I_a + \sum_{1 \leq i \leq m} (k_d C_d I_{di} + k_s C_s I_{si}) + k_r C_r I_r + k_t C_t I_t \]
- Accounting for shadows:
  \[ I_\lambda = k_a C_d I_a + \sum_{1 \leq i \leq m} S_i (k_d C_d I_{di} + k_s C_s I_{si}) + k_r C_r I_r + k_t C_t I_t \]
Shading

- OpenGL uses the **local** Phong Illumination Model.

\[ I = k_a I_a + \sum_{1 \leq i \leq m} (k_d I_{di} + k_s I_{si}) \]

- Where and how is colour of objects computed?
Shading

• Enabling lighting and individual lights
  - `glEnable(GL_LIGHTING);`
  - `glEnable(GL_LIGHT0);`

• Every GL implementation has at least 8 lights.

• Property for the lights is defined using:
  - `glLightf{v}(GLenum light, GLenum pname, GLfloat {*}param)`
  - `light` is the light enum like `GL_LIGHT1`
  - `pname` can be `GL_AMBIENT, GL_DIFFUSE, GL_SPECULAR, GL_POSITION, GL_SPOT_CUTOFF, GL_SPOT_DIRECTION, GL_SPOT_EXPONENT, GL_CONSTANT_ATTENUATION, GL_LINEAR_ATTENUATION, and GL_QUADRATIC_ATTENUATION`

Deprecated OGL2.x content. See the shading tutorial instead.
Shading

• For example:

```c
GLfloat light_ambient(0.0, 0.0, 0.0, 1.0);
GLfloat light_diffuse(1.0, 1.0, 1.0, 1.0);
GLfloat light_specular(0.0, 1.0, 0.0, 1.0);
GLfloat light_position(3.0, 4.0, 0.0, 1.0);
gLightfv(GL_LIGHT0, GL_AMBIENT, light_ambient);
gLightfv(GL_LIGHT0, GL_DIFFUSE, light_diffuse);
gLightfv(GL_LIGHT0, GL_SPECULAR, light_specular);
gLightfv(GL_LIGHT0, GL_POSITION, light_position);
gEnable(GL_LIGHT0);
```

Deprecated OGL2.x content. See the shading tutorial instead.
Shading

- Material properties can be specified using
  - `glMaterialf{v}(GLenum face, GLenum pname, const GLfloat{*} params);`
  - `face` can be `GL_FRONT`, `GL_BACK` or `GL_FRONT_AND_BACK`
  - `pname` can be `GL_AMBIENT`, `GL_DIFFUSE`, `GL_SPECULAR`, `GL_EMISSION`, `GL_SHININESS`, `GL_AMBIENT_AND_DIFFUSE`
  - Then colour is computed at:
    \[
    I_\lambda = k_a \lambda I_a + \sum_{1 \leq i \leq m} (k_{d\lambda} I_{d_i} + k_{s\lambda} I_{s_i})
    \]

Deprecated OGL2.x content. See the shading tutorial instead.
Shading

- Constant Shading – no interpolation of intensity, one intensity for whole object. No depth cues.

Pixar Shutterbug images from:
http://www.siggraph.org/education/materials/HyperGraph/scanline/shade_models/constant.htm
Shading

- Faceted Shading – One intensity per polygon computed from the surface normal and light vector. (GL_FLAT)

Pixar Shutterbug images from:
http://www.siggraph.org/education/materials/HyperGraph/scanline/shade_models/constant.htm
Shading

- Gouraud Shading – Linear interpolation of intensity across triangles to eliminate edge discontinuity. (GL_SMOOTH)
Shading

- Phong Shading – Interpolation of surface normals. Still local illumination – No GI.

Pixar Shutterbug images from:
http://www.siggraph.org/education/materials/HyperGraph/scanline/shade_models/constant.htm
Shading

- Shadows, texture mapping, reflection mapping – simulating GI.
Shading

- Faceted Shading
  - Fast
  - Surface does not look smooth if a piece wise linear approximation to a flat surface is being done

http://www.skidmore.edu/~hfoley/Perc4.htm
Shading

• Faceted Shading
  - `glShadeModel(GL_FLAT);`
Shading

- Gouraud Shading
  - Linearly interpolate intensity along scan lines: eliminates intensity discontinuities at polygon edges; still have gradient discontinuities, mach banding is largely ameliorated, not eliminated.
  - must differentiate desired creases from tesselation artifacts (edges of cube vs. edges on tesselated sphere).

- Calculate approximate vertex normals as an average of normals of polygons meeting at that vertex.
- Neighboring polygons sharing vertices and edges approximate smoothly curved surfaces and will not have greatly differing surface normals hence this approximation is reasonable.
- Calculate intensity at vertices.

\[
\vec{N}_v = \frac{\sum_{i=1}^{n} \vec{N}_i}{\parallel \sum_{i=1}^{n} \vec{N}_i \parallel}
\]
Shading

- **Gouraud Shading**
  - Linearly interpolate intensity along scan lines: eliminates intensity discontinuities at polygon edges; still have gradient discontinuities, mach banding is largely ameliorated, not eliminated.
  - must differentiate desired creases from tessellation artifacts (edges of cube vs. edges on tesselated sphere).

  \[
  I_a = I_1 \frac{y_s - y_2}{y_1 - y_2} + I_2 \frac{y_1 - y_s}{y_1 - y_2}
  \]
  \[
  I_b = I_1 \frac{y_s - y_3}{y_1 - y_3} + I_3 \frac{y_1 - y_s}{y_1 - y_3}
  \]
  \[
  I_p = I_a \frac{x_p - x_a}{x_b - x_a} + I_b \frac{x_p - x_a}{x_b - x_a}
  \]

- Interpolate intensity along polygon edges.
- Interpolate along scan lines.

{
    norm = normalize( NormalMatrix * VertexNormal );
    position = vec3( ModelViewMatrix * vec4( VertexPosition, 1 ) );
}

vec3 light( int lightIndex, vec3 position, vec3 norm )
{
    vec3 s = normalize( vec3( Light[lightIndex].Position - position ) );
    vec3 v = normalize( -position.xyz );
Shading

```cpp
vec3 spec = vec3( 0.0 );

if ( sDotN > 0.0 )

    spec = Light[lightIndex].Ls * Material.Ks * 
          pow( max( dot(r,v) , 0.0 ), Material.Shininess );

return ambient + diffuse + spec;
```

```cpp
void main()
{
    vec3 eyeNorm;
    vec3 eyePosition;
    getEyeSpace( eyeNorm, eyePosition );

    data.FrontColor = vec3(0);
    data.BackColor = vec3(0);

    for( int i=0; i<LIGHTCOUNT; ++i )
    {
        data.FrontColor += light( i, eyePosition, eyeNorm );
    }
}
```
Shading

- Gouraud Shading
  - `glShadeModel(GL_SMOOTH);`
Shading

- Gouraud Shading
  - Integrates well with scanline rasterization. On an edge $\frac{\Delta I}{\Delta y}$ is constant.
  - vs. Faceted Shading
Shading

• Gouraud Shading
  - Can miss specular highlights because it interpolates vertex colors instead of calculating the intensity at every surface point.

• Interpolate normals instead – comes closer to actual surface normal.

• Called *Phong Shading* (Note: NOT Phong Illumination Model)
Shading

- Phong Shading
  - Interpolate normals along scan lines.
  - Normalize after interpolating (expensive!).
  - Not available in plain OpenGL – done as per pixel lighting on hardware.
  - Still no Global Illumination – most of the effects of Ray Tracing still missing.
Shading
