Context Sensitive(CoS) SSA for Interprocedural Program Analysis and Optimisation

Supriya Bhide<sup>1</sup>, Sathwika Reddy<sup>1</sup>, Arpana Prajapati<sup>1</sup> Pritam Gharat<sup>2</sup> Uday Khedker<sup>1</sup> Alan Mycroft<sup>3</sup> <sup>1</sup>IIT Bombay, <sup>2</sup>Microsoft Research India, <sup>3</sup>University of Cambridge

## What is CoS-SSA

- Works at Interprocedural level
- Gives flow and context sensitivity for free
- Enables sparse interprocedural analyses and optimisations
- Handles global variables and pointers context sensitively
- Subsumes classical SSA as a special case

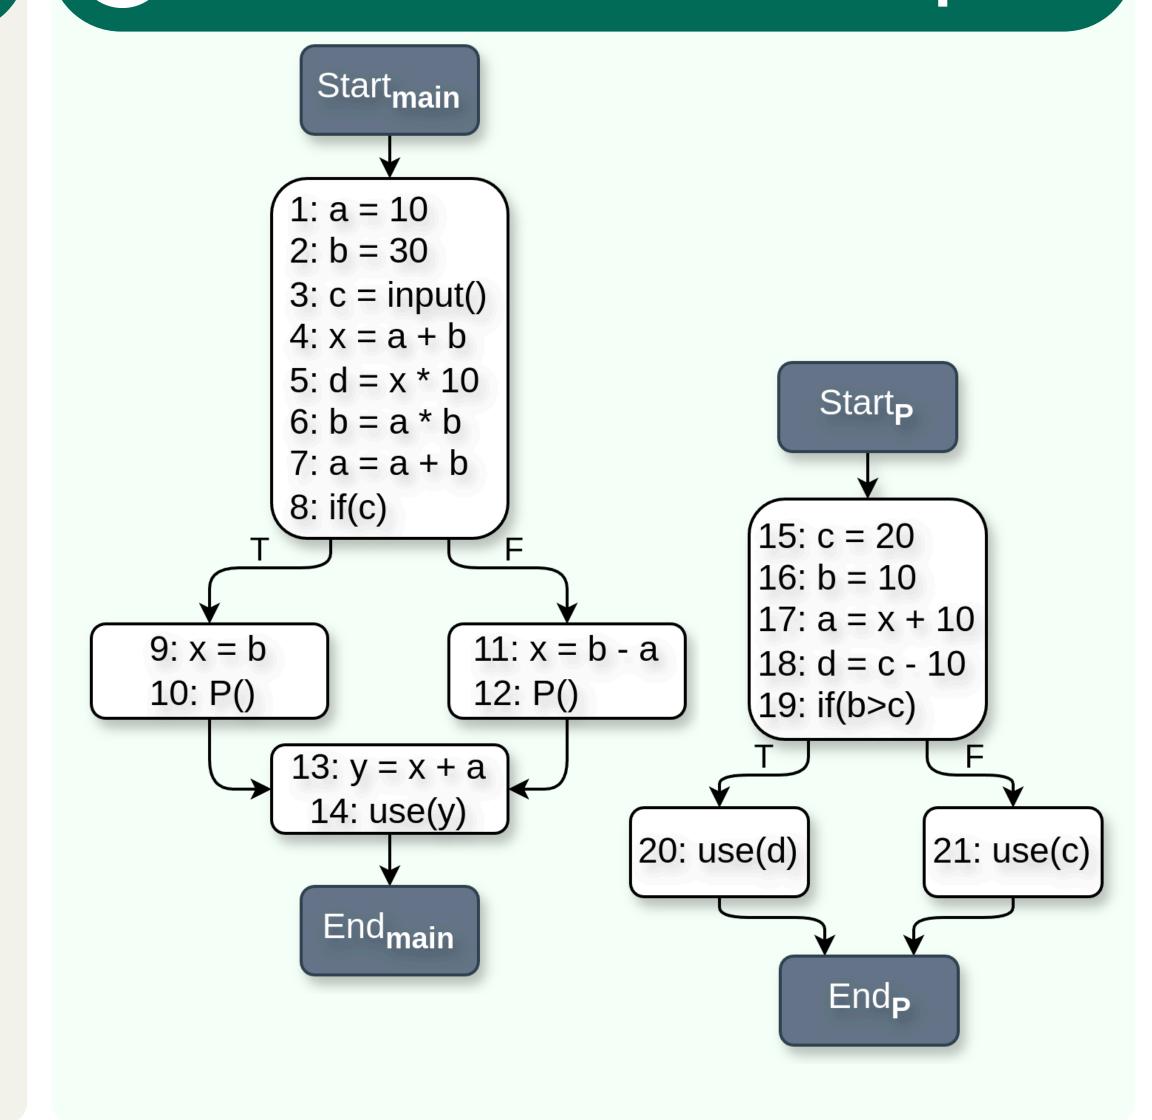

### How Do We Obtain It

We obtain CoS-SSA by constructing Data Dependence Graph (DDG) and mutating definitions to make them context-sensitive

### Source Code

```
int a, b, c, d, x,y;_{26} void P()
 void main()
                                c = 20;
         10;
                                a = x + 10;
                                d = c - 10;
     c = user_input();
                                if(b>c)
                                   use(d);
                                else
                                   use(c);
                           37
     if(c){
             x = b;
     else{
18
     y = x + a;
use(y);
```

## CFG of Our Example

# CoS-SSA

Startmain

1:  $a_1 = 10$ 

2:  $b_1 = 30$ 

3:  $c_1 = input()$ 

4:  $x_1 = a_1 + b_1$ 

5:  $d_1 = x_1 * 10$ 

6:  $b_2 = a_1 * b_1$ 

7:  $a_2 = a_1 + b_2$ 

13:  $x_4 = \phi(x_2, x_3)$ 

14:  $a_5 = \phi(a_3, a_4)$ 

15:  $y_1 = x_4 + a_5$ 

End<sub>main</sub>

16: use(y<sub>1</sub>)

8: if(c<sub>1</sub>)

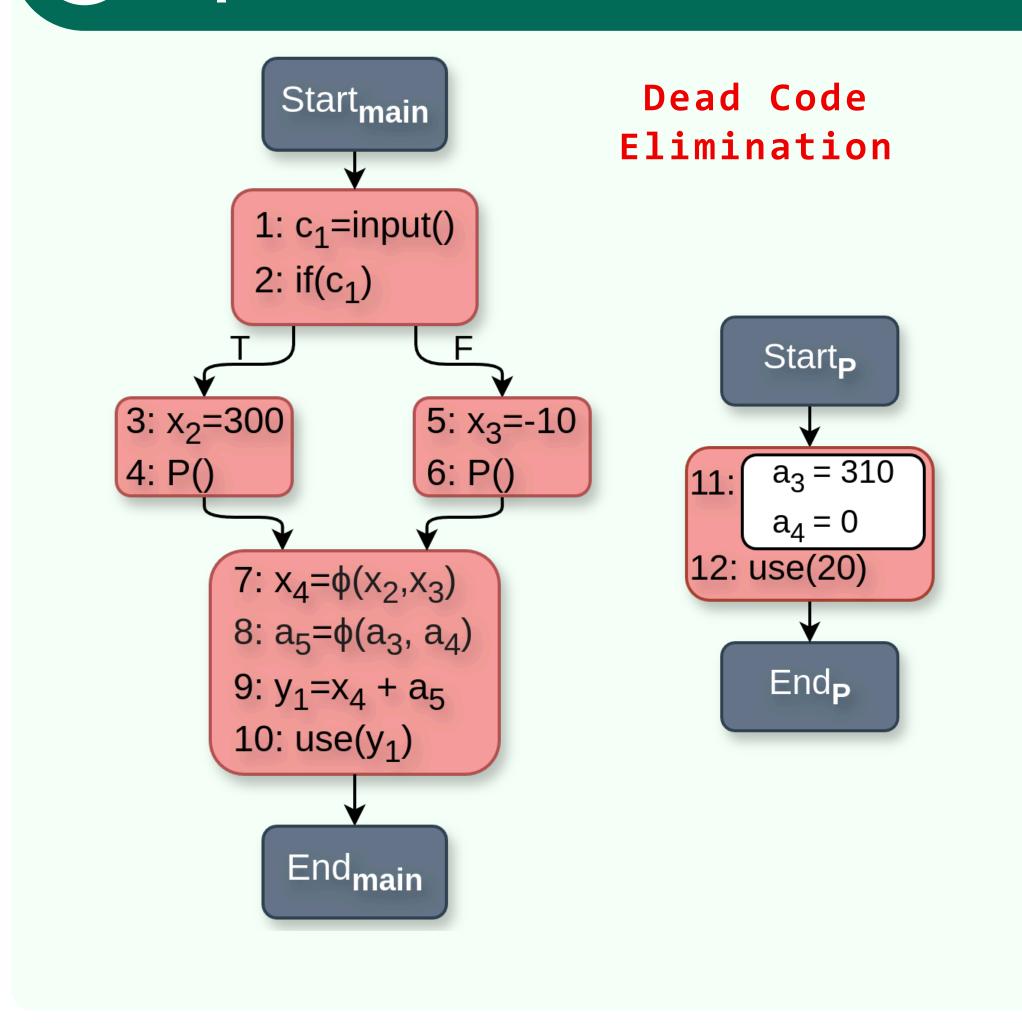

9:  $x_2 = b_2$ 

10: P()

# Data Dependence Graph

### Mutation

- We compute the Data Dependence Graph (DDG) using a bottom-up traversal over the callgraph
- We inline the DDG of callee procedures at the respective call sites in the caller procedures
- While doing so, if any definition  $x_n^{\alpha}$  in the callee depends on any definition in the caller we mutate  $x_n^{\alpha}$  to distinguish the dependence of  $x_n$  in different invocations of the callee
- Mutation is achieved by updating the context  $\alpha$  to include the call site where the inlining occurs.
