Bridging the gap between Course Work and Real Life Problems

Under the guidance of Prof. Milind Sohoni

Charu Agarwal

IIT Dharwad

March 31, 2018

Today...

- What is the current course structure?
  - How to apply the concepts taught in classroom.
  - Connection with reality.
  - How can we enrich our curriculum?
  - Why engagement with society is important?
- Case Studies
  - Analysing data. The census. The railway system. The bus-depot.
- The Dharwad City Bus Depot
  - Various steps and its connection with our curricula.
  - Intermediate and final output.

What is the current course structure

and what is its connection to everyday problems?

- Asymptotic Notation
- Sorting and Searching
- Divide and Conquer
- Greedy Algorithms
- Graph Theory
- Dynamic Programming
- NP-completeness
- and much more.....

What is the current course structure

and what is its connection to everyday problems?

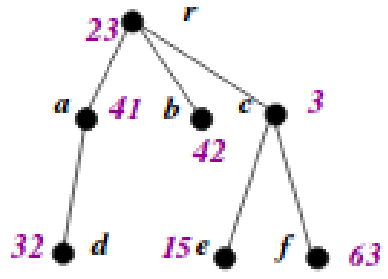
- Asymptotic Notation
- Sorting and Searching
- Divide and Conquer
- Greedy Algorithms
- Graph Theory
- Dynamic Programming
- NP-completeness
- and much more.....

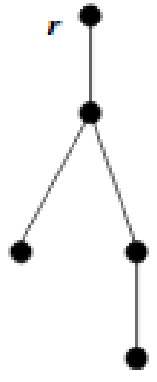
How to adapt them to everyday life?
Real Life Problems are manifold complex than standard textbook problems!

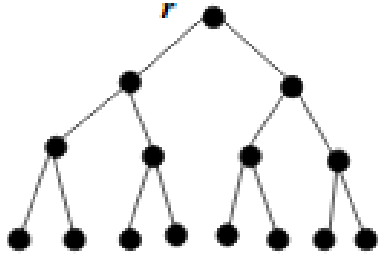
What is being taught?

A rooted tree

Rooted Tree: $T(V, E), r$ is a rooted tree iff (i) T is a tree and $r \in V$ is a vertex (called the **root**, and (ii) there is a function call $level : V \to \mathbb{Z}$ such that (a) $level(r) = 0$, (b) $level(v) \geq 0$, and (c) each vertex v of level $d > 0$ is connected to exactly one vertex w of level $d - 1$. Then w is called the **parent** of v and v the **child** of w. A vertex with no children is called a **leaf node**.





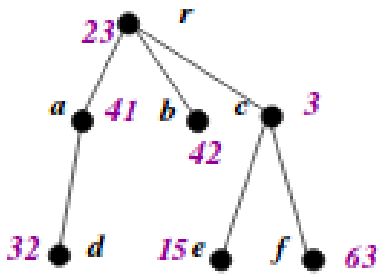


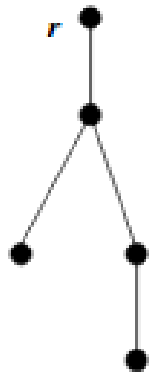
A tree with n vertices has exactly $n - 1$ edges.

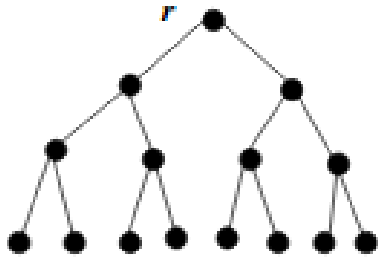
What is being taught?

A rooted tree

Rooted Tree: $T(V, E), r$ is a rooted tree iff (i) T is a tree and $r \in V$ is a vertex (called the **root**, and (ii) there is a function call $level : V \to \mathbb{Z}$ such that (a) $level(r) = 0$, (b) $level(v) \geq 0$, and (c) each vertex v of level $d > 0$ is connected to exactly one vertex w of level $d - 1$. Then w is called the **parent** of v and v the **child** of w. A vertex with no children is called a **leaf node**.





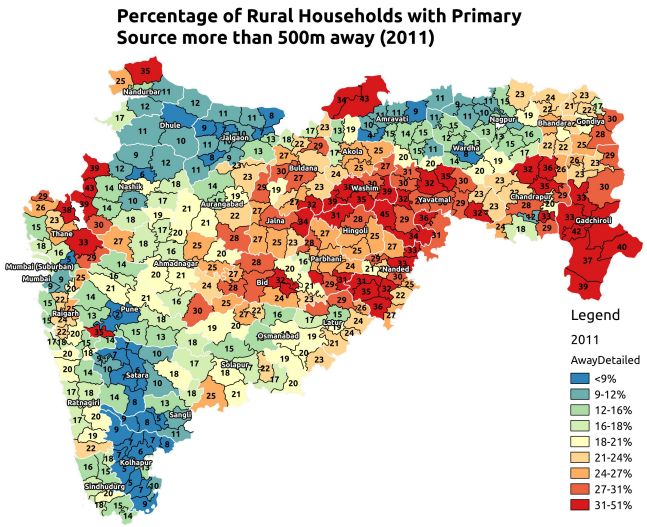


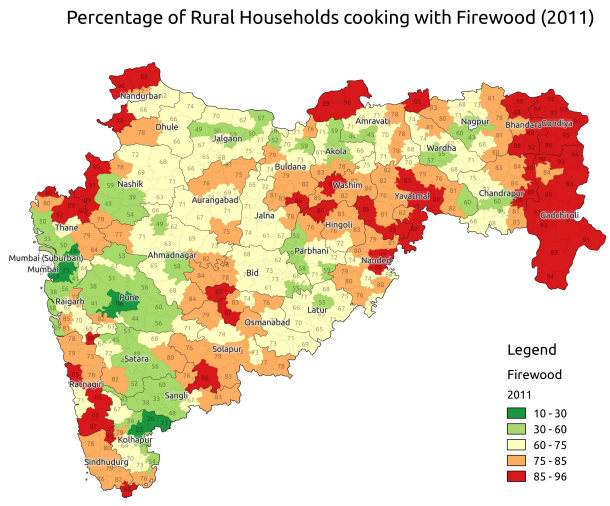
A tree with n vertices has exactly $n - 1$ edges.

Too much abstraction!

And what is the reality ...

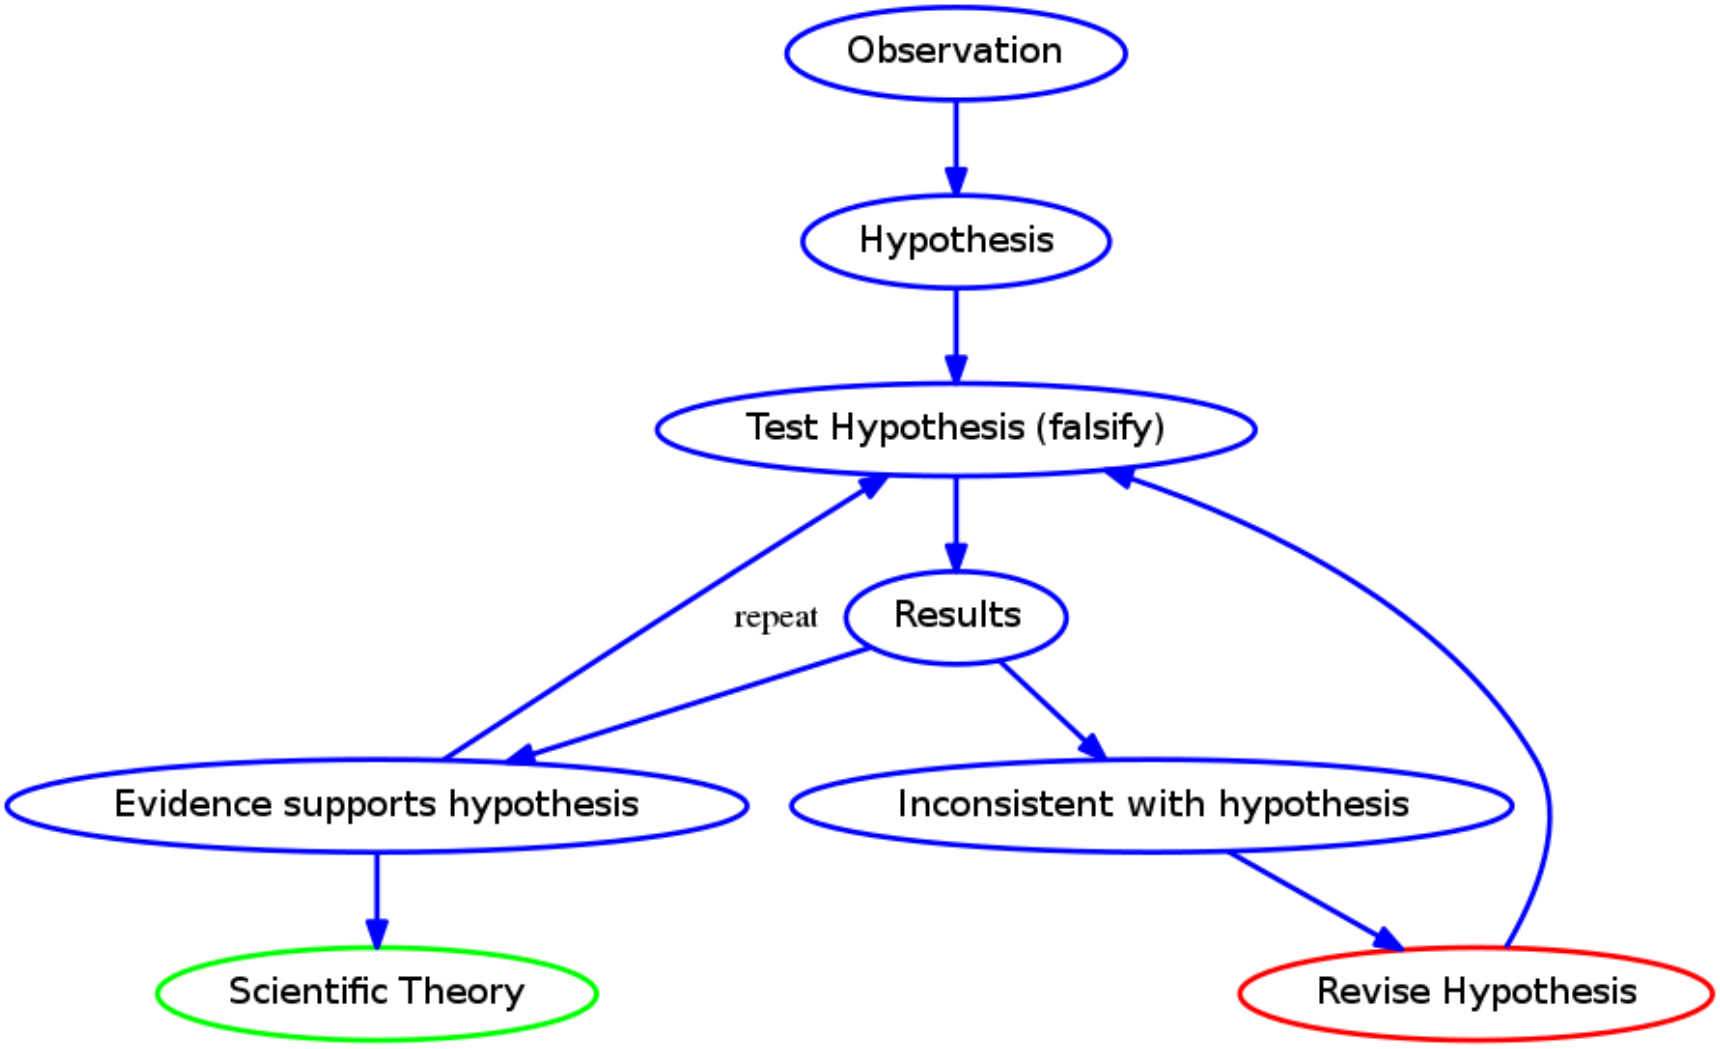
And what is the reality ...





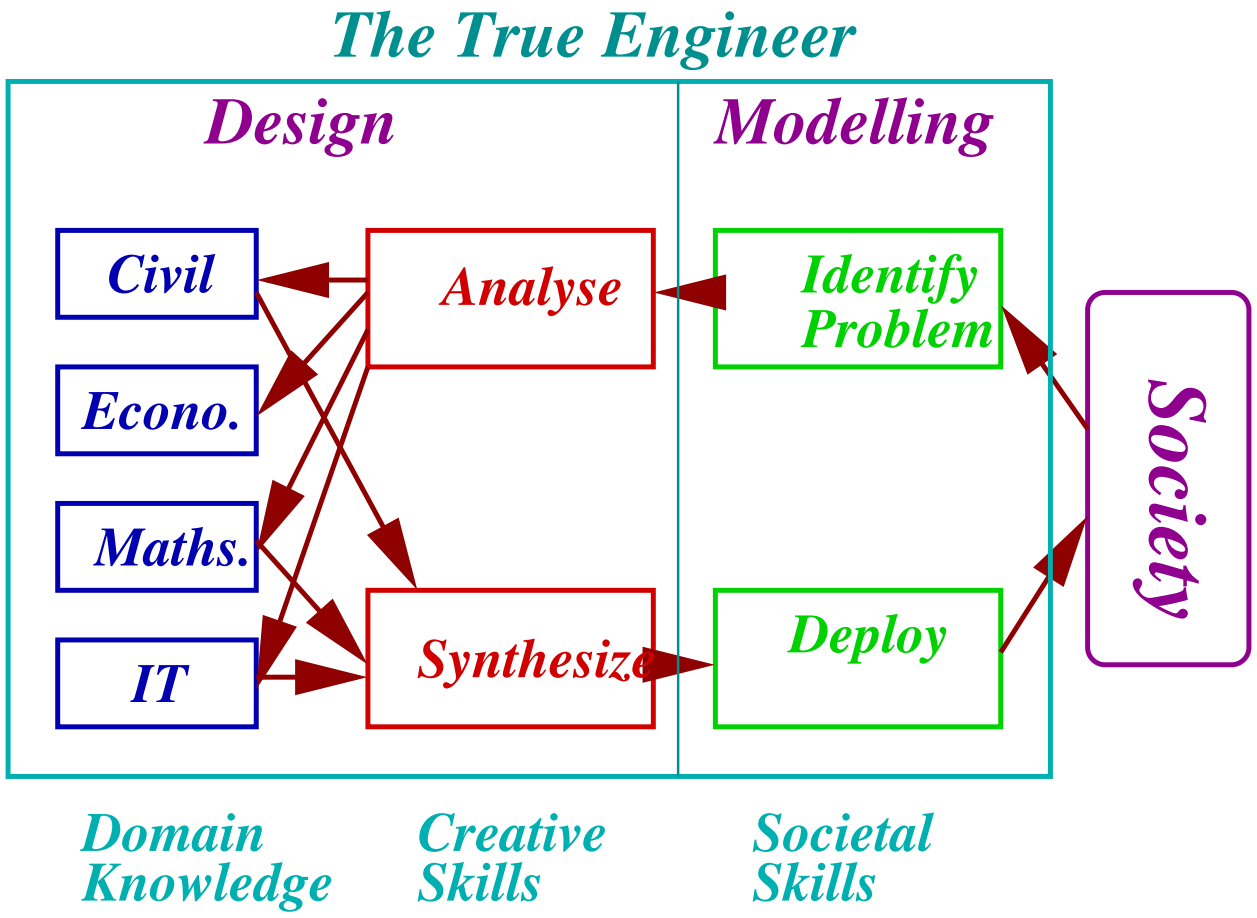
Data from Census 2011

Science



Scientific Method Flow Chart

Engineering



Engineering v/s Science

- Scientist describes society, engineer wants to change it. So how should the change be?
- Obviously which generates value, which is why we engineers need to understand society and how it operates.

Ref: "Engineering Teaching and Research and its Impact on India", CURRENT SCIENCE, VOL. 102, NO. 11, 10 JUNE 2012 (https://www.cse.iitb.ac.in/ sohoni/RD.pdf)

Problem Statement

- How do we analyse a real-life situation?
- How to use our course-material to model real-life situations.

Solutions?

Students and Case Studies

- Untapped resources of our country
- Can work in teams with the government
- Benefit of society
- Hands-on experience for students

Solutions?

Students and Case Studies

- Untapped resources of our country
- Can work in teams with the government
- Benefit of society
- Hands-on experience for students

Several development issues require good engineering methodology!

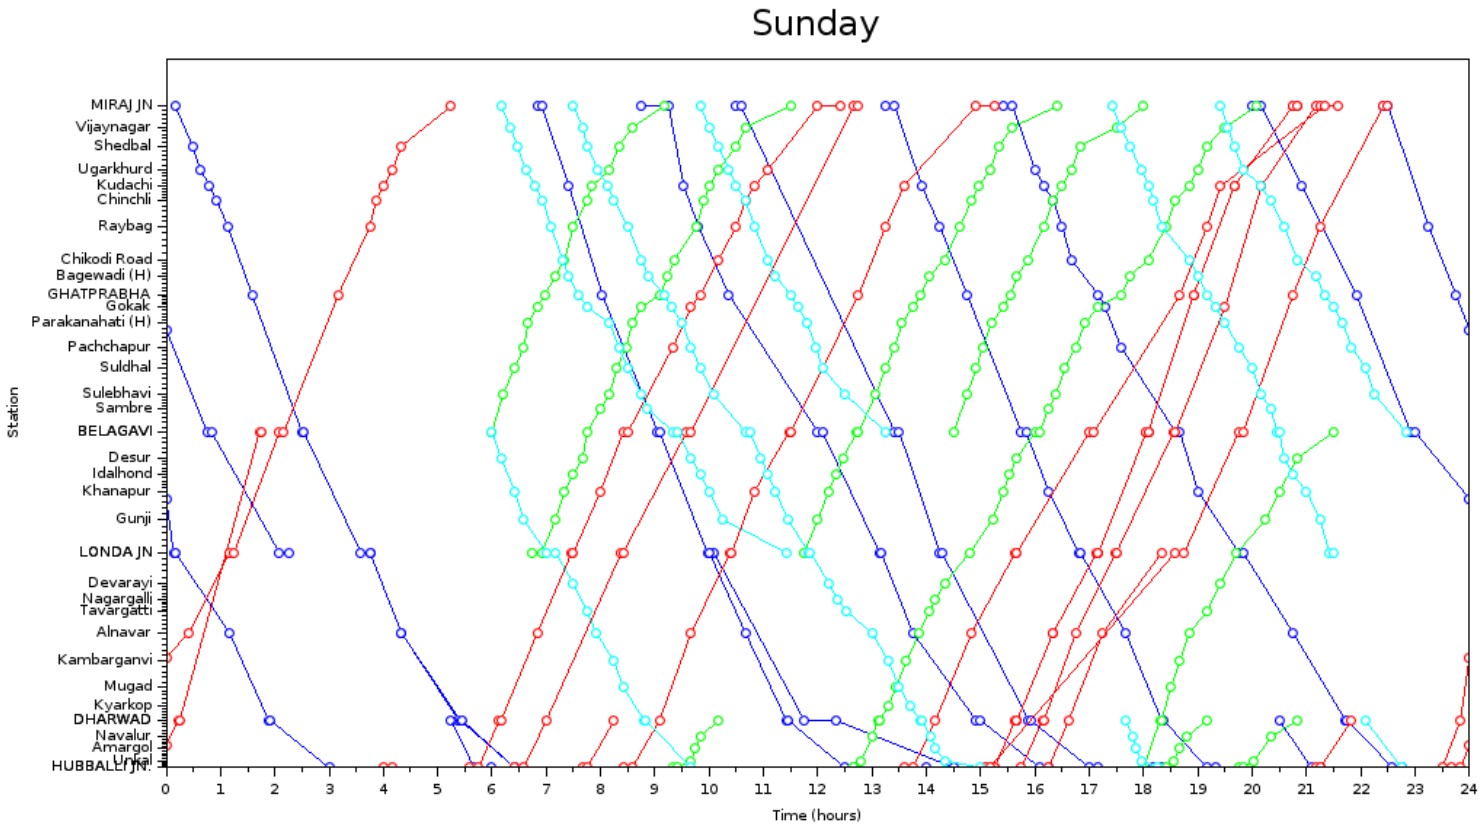
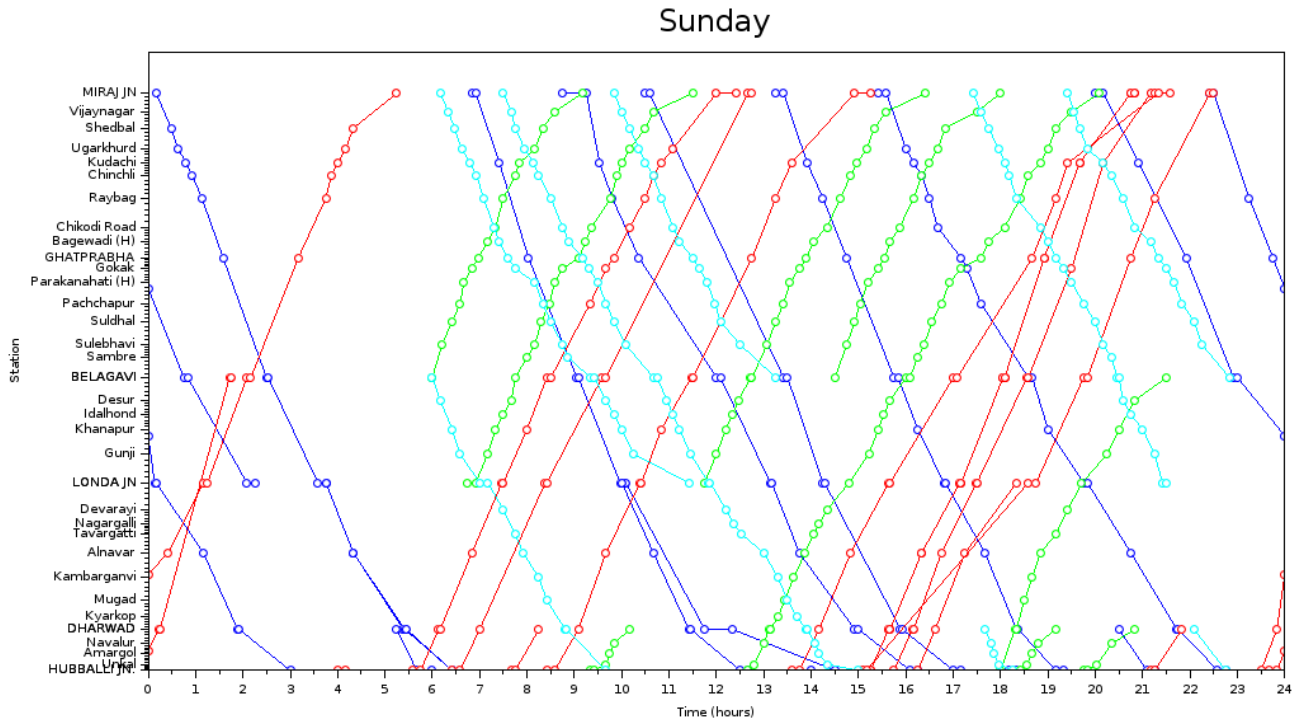
...To Graphical Visualization



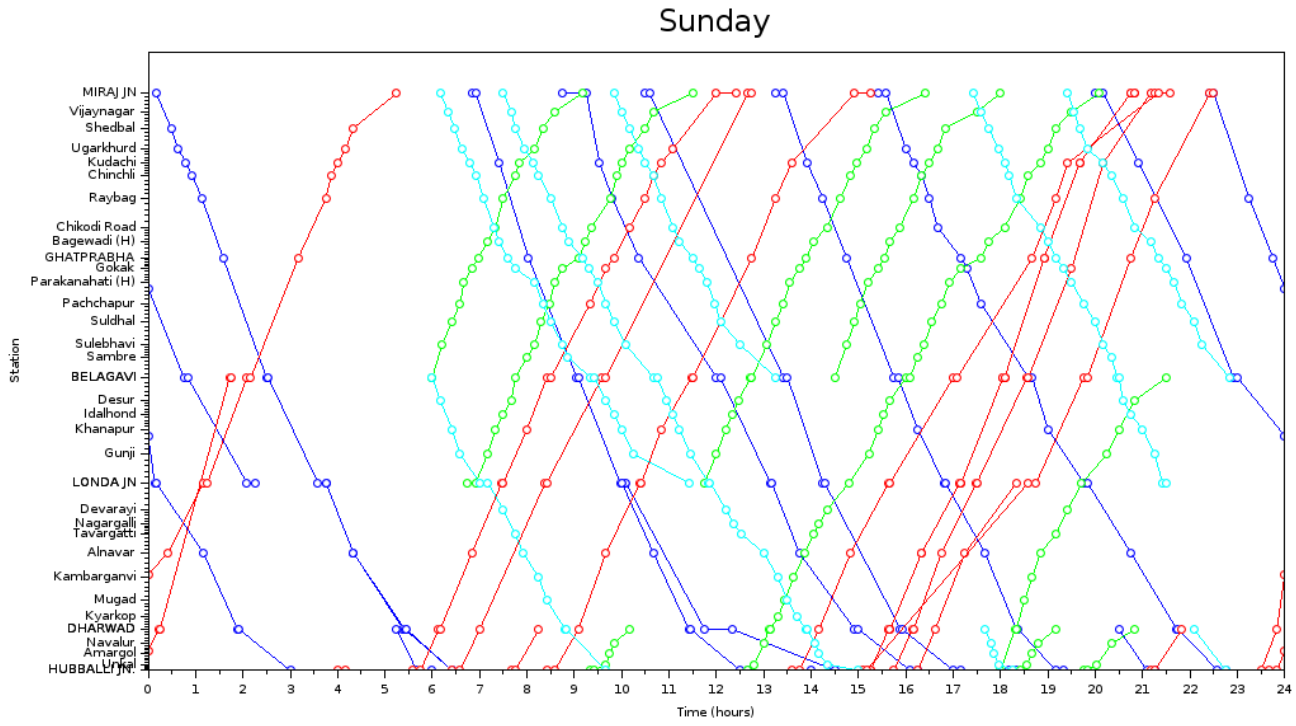
Software Used: Scilab

...To Graphical Visualization



- Space-time representation of timetable
- Can be used to analyze bottlenecks in schedule, minimization of delays, possible collision domains.
- Time Table Optimization!

...To Graphical Visualization



The above example was based on secondary data and its analysis. That is important too, since it trains you in understanding how to represent and what would be of interest to people and the limitations of the implementation agency, in this case, a single track. Also understand what could be changed, e.g., signal spacing and loops, but that needs primary work. The next example is different.

Dharwad bus Depot

The Dharwad Bus Depot

- One of the eight division headquarters under North Western Karnataka Road Transport Corporation.
- operates 208 schedules with strength of 228 vehicles.
- covers 55k kms and is utilising the services of 1000 regular employees, which includes Officers, Supervisory and Administrative staff, Mechanical staff and Drivers and Conductors.
- Plethora of natural data generated on a daily basis.

Form IV(The city bus schedule)

Form IV: Our first Data-set

The Schedule

- `SCH.NO.`: The Schedule Number (Typical schedule is 8 hours long.)
- `TRIP`: trip number
  - `FROM` and `TO`: The first and last stops.
  - `KM`: distance covered
  - `DEP` and `ARR` : departure and arrival timings
  - `VIA`: place en route

Very linear representation of data.

- No information about sub-stops.
- Does not describe the spatial distribution of route-data.
- Insufficient for proper analysis.

Questions

It is natural to generate many domain specific questions of value:

- Passenger: What is the route to travel from Ganesh Temple to Central School, starting at 7:15 AM, in the minimum possible time?
- Depot Manager: How to maximize the profit subject to budget constraints?
- Planning Committee: Which are the more profitable areas to add a new bus route?
- Researcher : How much percentage of the rural population has access to a bus within 500m?

Questions

It is natural to generate many domain specific questions of value:

- Passenger: What is the route to travel from Ganesh Temple to Central School, starting at 7:15 AM, in the minimum possible time?
- Depot Manager: How to maximize the profit subject to budget constraints?
- Planning Committee: Which are the more profitable areas to add a new bus route?
- Researcher : How much percentage of the rural population has access to a bus within 500m?

We will answer the first question through this study and do preliminary work to answer the other questions.

Work done at IIT Dharwad

The 39 students of the course CS213 (Jan. 2017-May. 2017), at IIT Dharwad map Dharwad city bus routes.

- They first analyze the 8000-line city bus schedule.
- prepare a summary and allocate routes
- travel them and generate kml files
- and finally compile them together.

Summary and Route Allocation

S. No.	Sch. No.	From	To	Km	Via	Name	Roll No.	Status	Route No.
1	DCS-45	CBT	ADARSHA NAGAR	7	KCD, DSK,SDN,ADS	Deeksha, Adhok	32, 33	Done	1

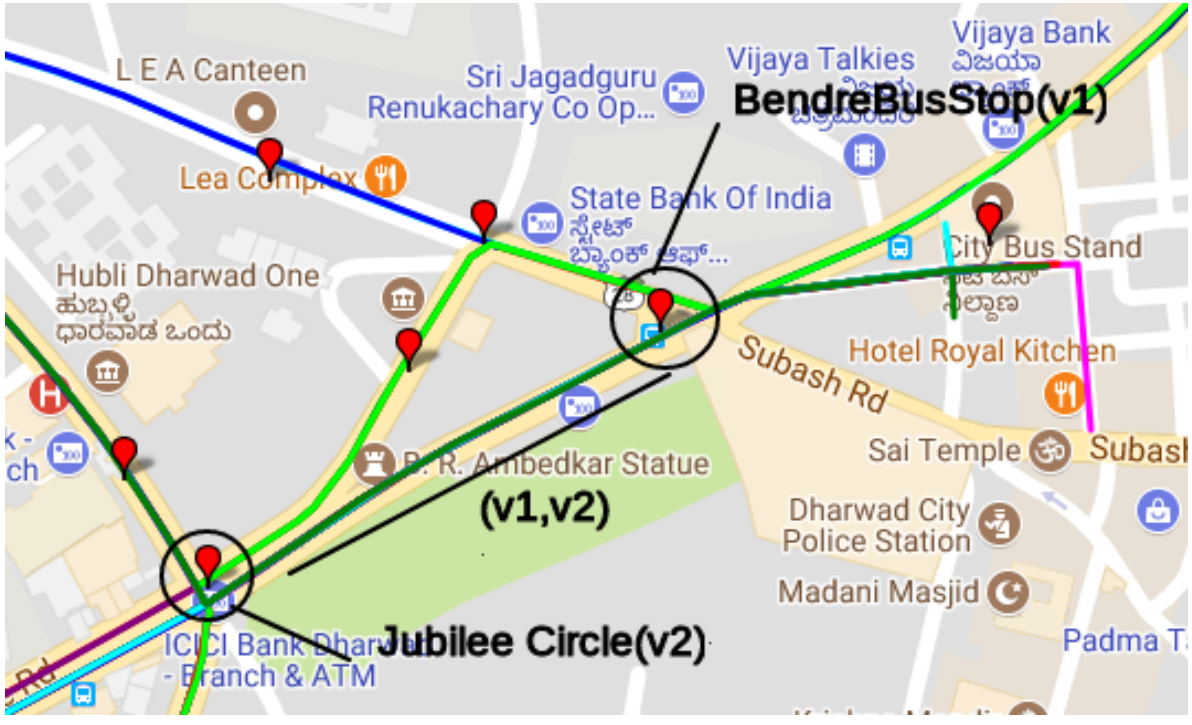
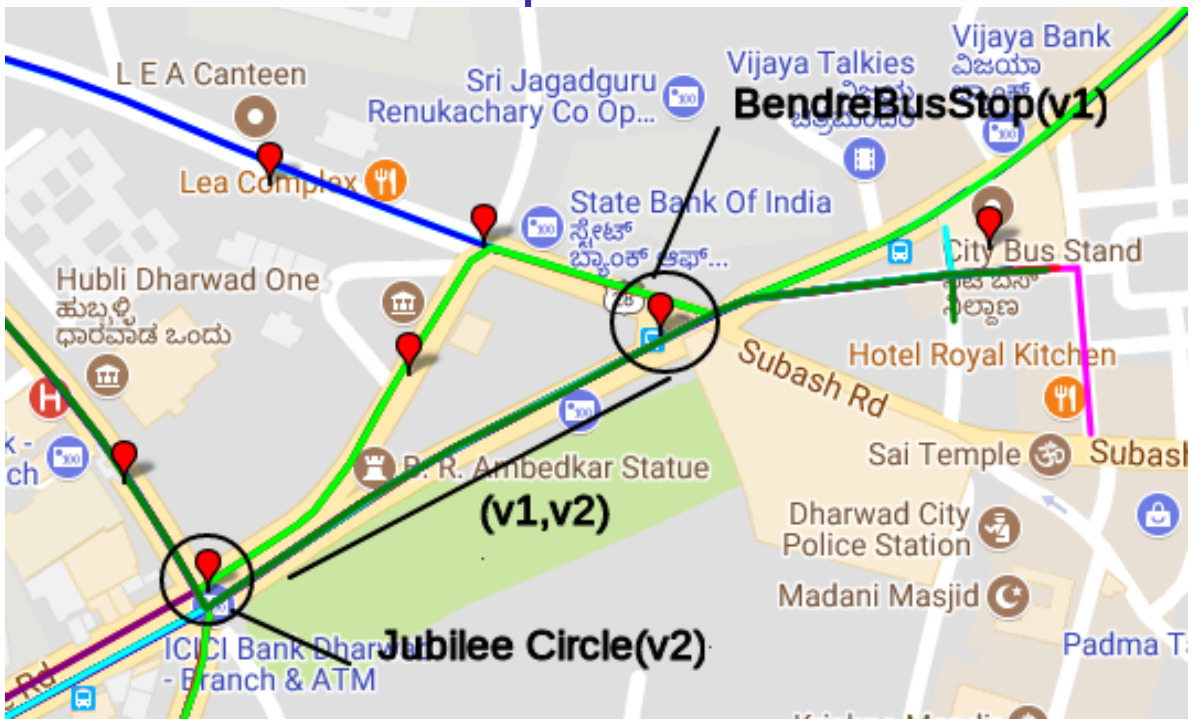
75 distinct routes were allocated to the students, out of which 12 were reported to be disfunctional or duplicate.

The Representation



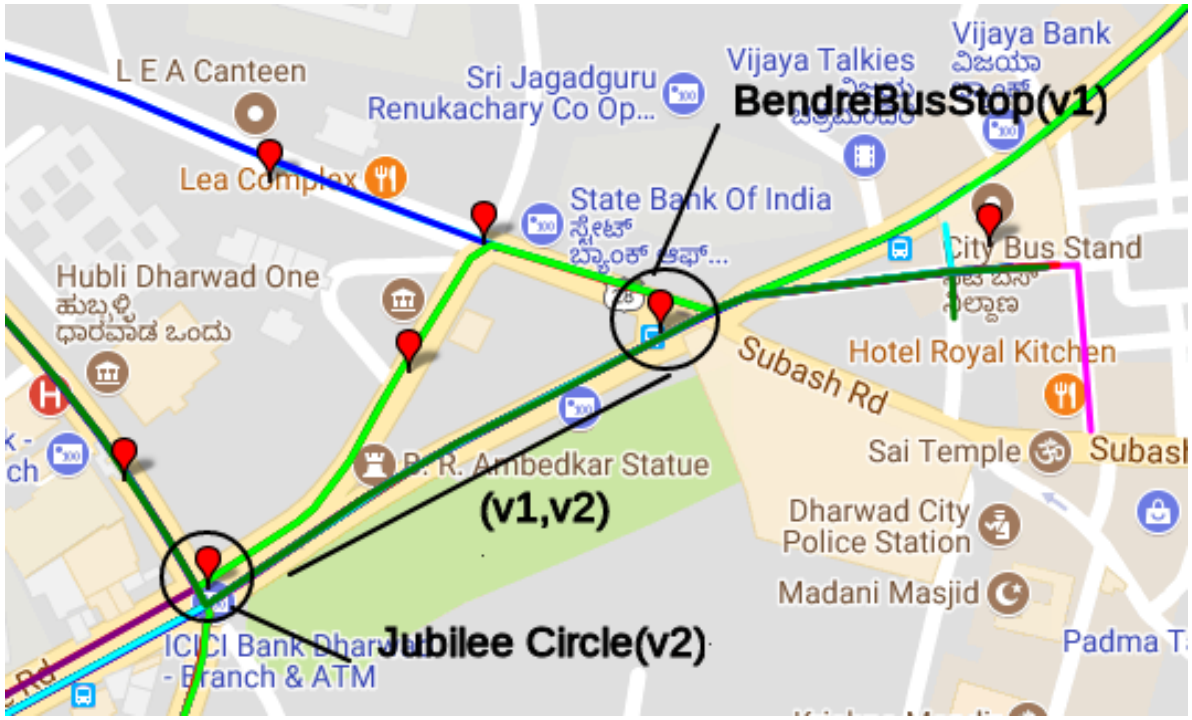
A graph $G(V, E)$ is eminently suitable to represent locations (as vertices) and paths between locations (as edges).

The Representation



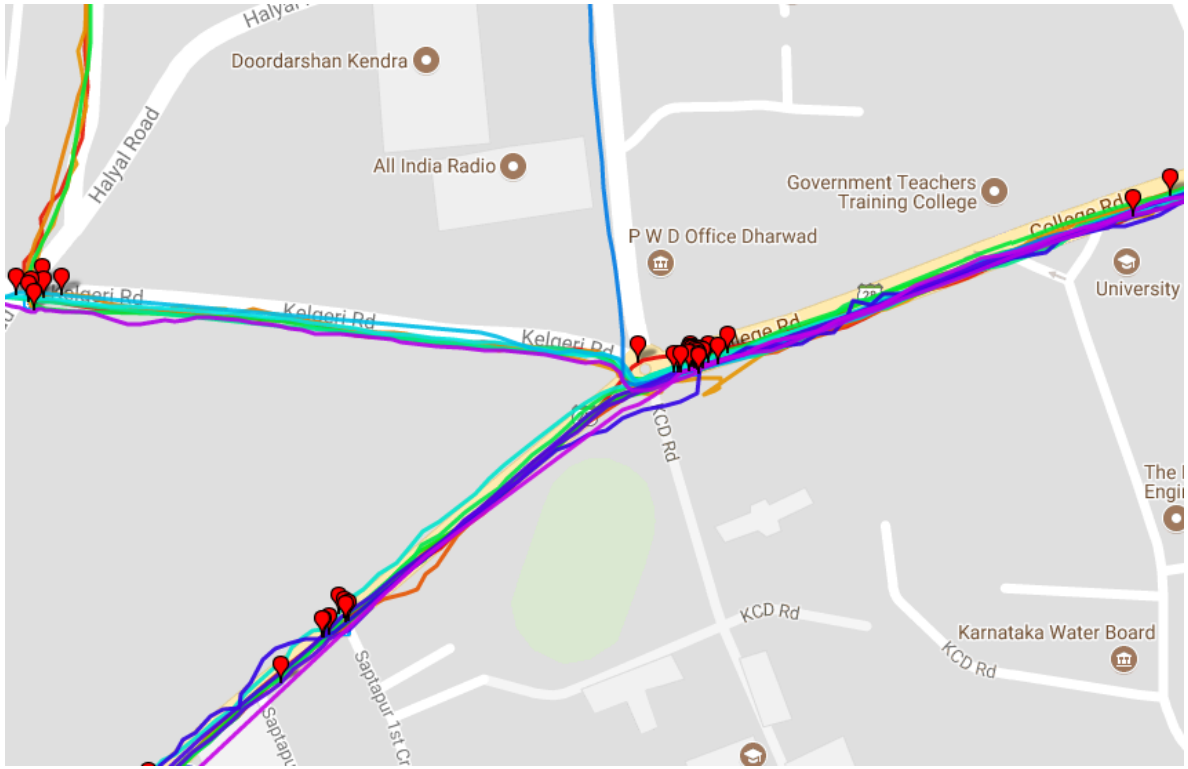
- The place (v) represents an actual location and contains location data (latitude-longitude (lat-long)), name and other attributes specific to the place and the route on which it lies.
- An edge consists of two places (v_1, v_2) and a track between them.
- A route consists of a sequence of places, connected by the edges.

The Representation



- A service from v_i to v_j, $S(v_i, v_j, t_0, d)$, consists of a route followed by a bus along with the start time(t_0) and the trip duration (d).
- Finally, a schedule is a set of services carried out by a single bus.

Figure: The KML tracks generated from real-time GPS tracking.

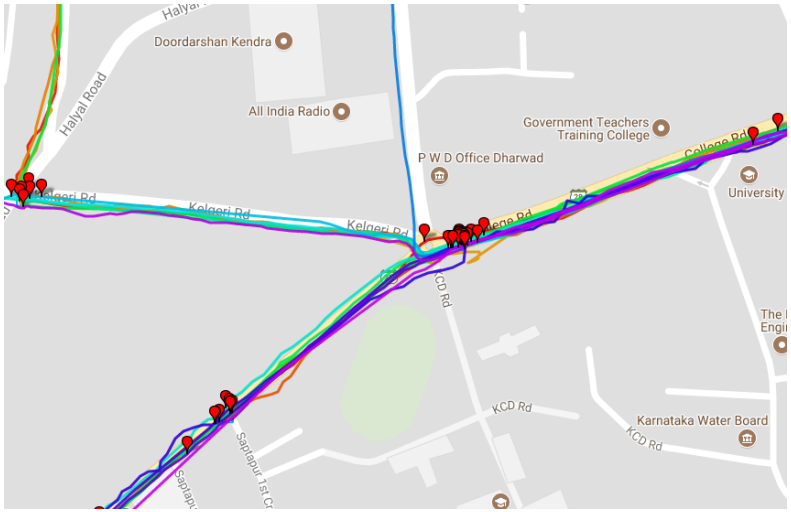


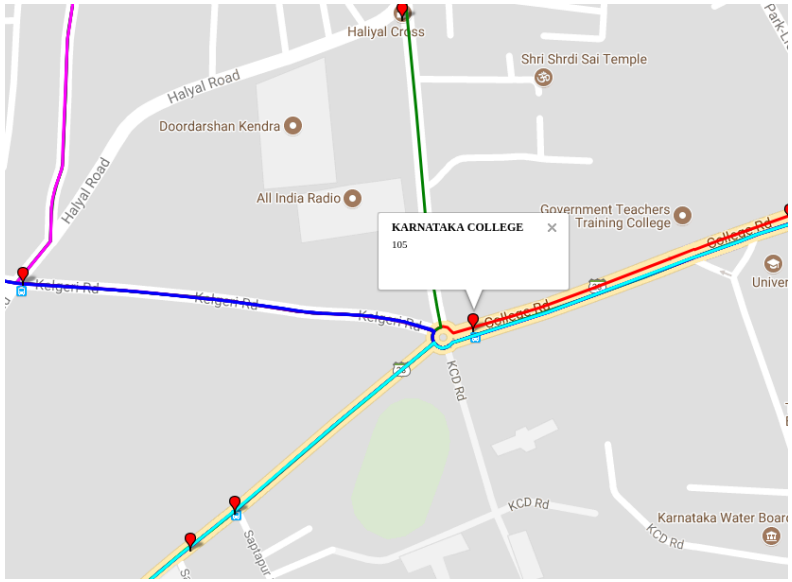
Some Issues

- The KML tracks are irregular and not aligned to official road polylines.
- Multiple coordinates and multiple names for the same stops.
- Names in the schedule are not standardized.
- Data not fit for graph representation.

Cleanup

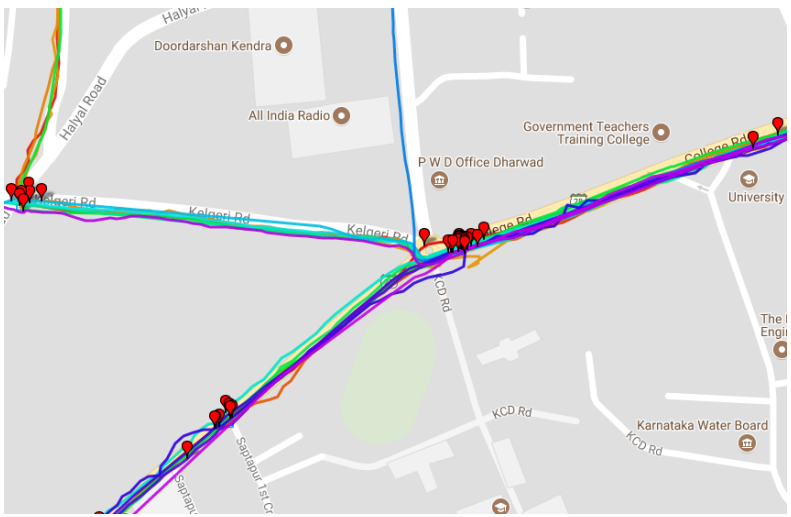
- Clustering of Stops
  We used a clustering algorithm (see breadth-first search) using connected components to cluster stops within 50 m into unique stops.

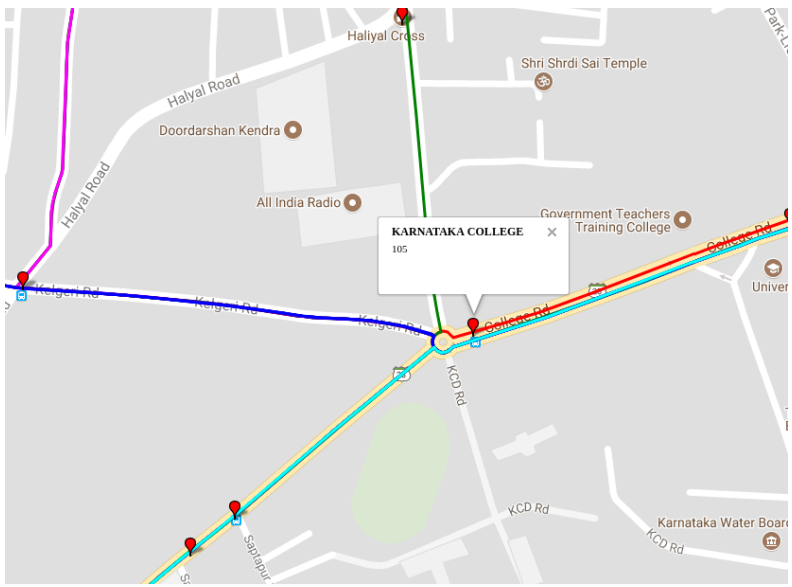




Cleanup

- Fitting the GPS generated tracks with the Google Map Roads
  It was decided that the edges between places (whose preliminary lat-longs and names are now available) will follow existing roads, i.e., polylines as shown by Google Maps. To align the tracks with the official road polylines, we used a Google API

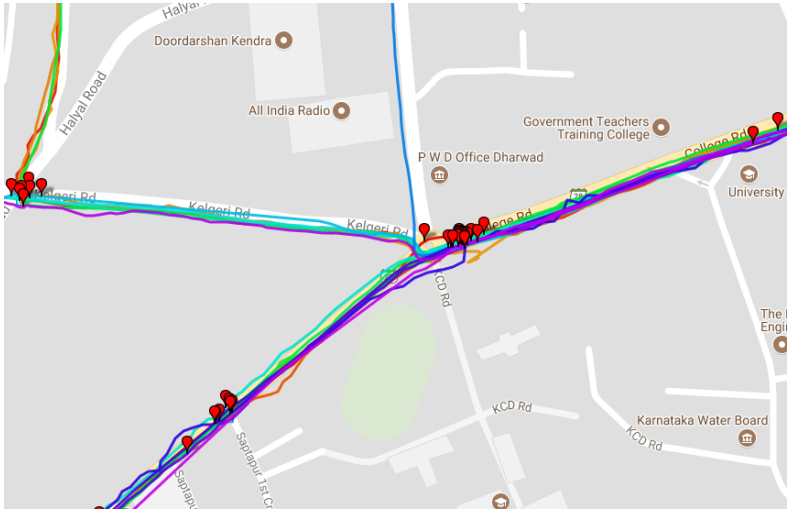




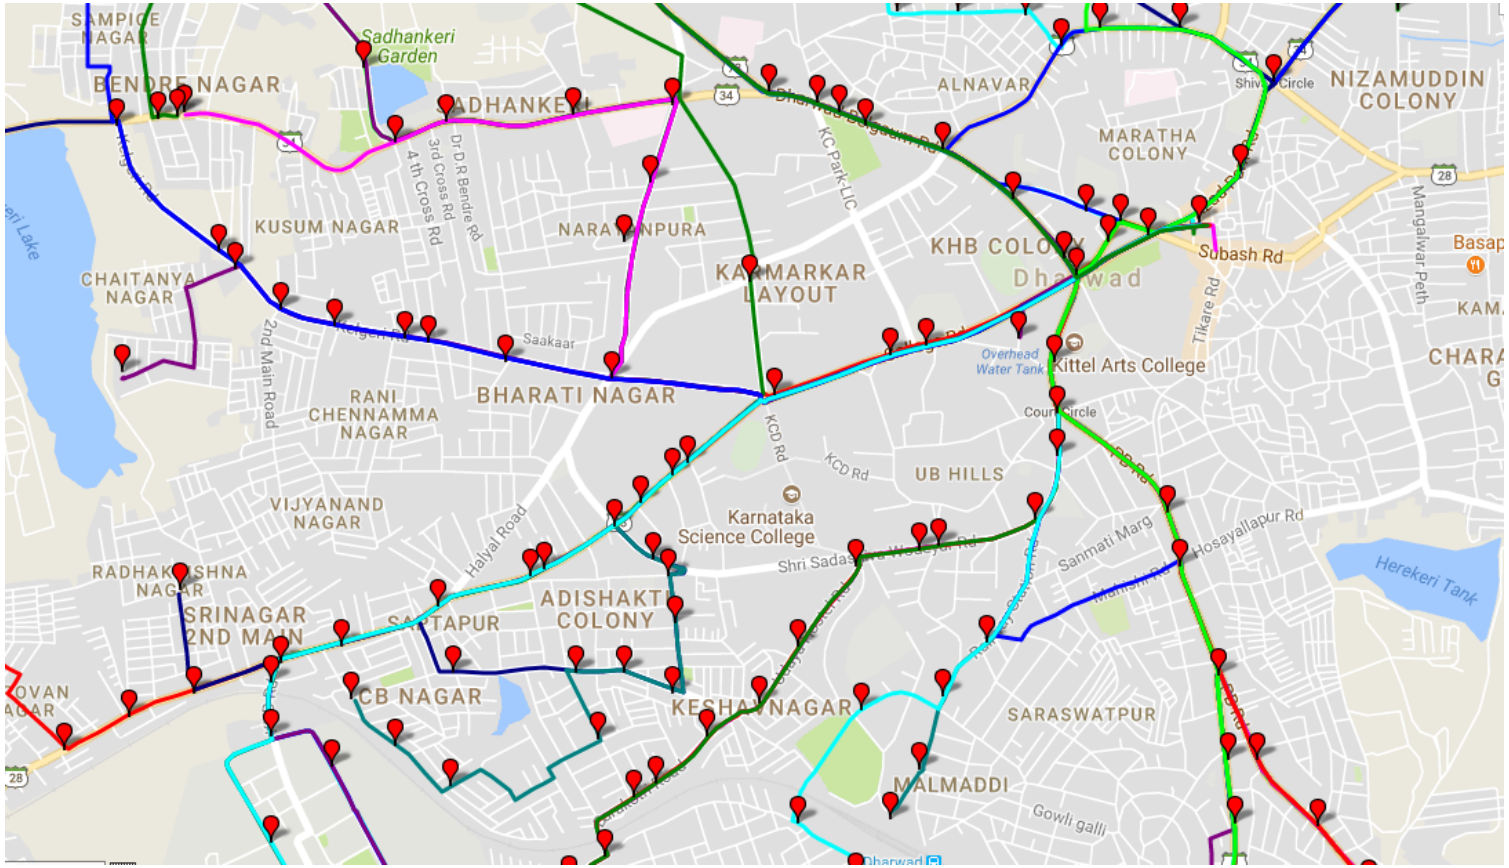
Cleanup

- Inserting stops into polylines

  As the data was generated from one trip only, many buses did not stop at all the stops which lie on the route depending on the ridership that day. So, we then wrote a program which took all the stops, computed its minimum distance from the track and inserted it into the track O_i if the distance was less than some chosen epsilon.



After Cleanup



Question Revisited

Question: How can you reach Srinagar from High Court in the minimum possible time starting at time t_0?

Question Revisited

Question: How can you reach Srinagar from High Court in the minimum possible time starting at time t_0?
This can be modelled as a graph theory problem.

Question Revisited

Question: How can you reach Srinagar from High Court in the minimum possible time starting at time t_0?

This can be modelled as a graph theory problem.

- Here the vertices(V) are the bus stops.
- Let v_0= Srinagar and v_n=High Court.
- There edges are the services.
- The edge weights are the trip length of the service $S(v_i, v_j, t, d)$.

Question Revisited

- Initialization: The edge cost of $S(v_0, v_i, t, d) = (t - t_0) + d$ where $(t - t_0) > 0$, ∞ otherwise.
- Constraint: (v_i, v_j) can be followed by (v_j, v_k) iff arrival time$(S(v_i, v_j, t_1, d_1)) <$ departure time$(S(v_j, v_k, t_2, d_2))$.
- Run Dijkstra's algorithm and get the shortest path from v_0 to v_n.

Ref: https://en.wikipedia.org/wiki/Dijkstra's_algorithm

Can we do better?

- Suppose there are k routes with n stops each and 1 route has m trips in a day, the number of edges becomes $(n-1) \times k \times m$.
- So the complexity of above alogrithm is $O((n-1) \times k \times m + |V| log |V|)$!
- This is significant amount of computation if done on the average mobile phone processors.

Can we do better?

- Solution: Edge generation on demand.
- Note that we are only interested in the next bus.
- So instead of explicitly storing the edges for all buses, we simply compute the cost of next bus from the current time.
- This brings the complexity of the algorithm by a multiplicative factor of m : Significant Improvement

Can we do better?

- Solution: Edge generation on demand.
- Note that we are only interested in the next bus.
- So instead of explicitly storing the edges for all buses, we simply compute the cost of next bus from the current time.
- This brings the complexity of the algorithm by a multiplicative factor of m : Significant Improvement

Our algorithm is ready to be implemented on a mobile phone!

Algorithm 1 Algorithm for finding bus route

procedure RoutePlanner(Graph, source, destination, start time)
    create vertex set Q
    for each vertex v in Graph **do** ▷ Initialization
        $dist[v] \leftarrow \infty$ ▷ Unknown distance from source to v
        $prev[v] \leftarrow UNDEFINED$ ▷ Previous edge in optimal path from source
        $arrival\_time[v] \leftarrow \infty$ ▷ Stores the best arrival time at each vertex
    end for
    add v to Q ▷ All nodes initially in Q (unvisited nodes)
    $dist[source] \leftarrow 0$ ▷ Distance from source to source
    $arrival\_time[source] \leftarrow start\ time$
    while Q is not empty **do**
        $u \leftarrow$ vertex in Q with min dist[u] ▷ Node with the least distance will be selected first
        remove u from Q
        if u is destination **then**
            break ▷ no need of further computation
        end if
        for each edge starting from u **do** ▷ where v is still in Q
            $length(u, v) \leftarrow waitingtime(arrival\_time[u]) + length(u, v)$ ▷ re compute edge cost
            $alt \leftarrow dist[u] + length(u, v)$
            if alt $<$ dist[v] **then** ▷ A shorter path to v has been found
                $dist[v] \leftarrow alt$
                $prev[v] \leftarrow e(u, v)$
                $arrival\_time[v] \leftarrow arrival\_time[u] + length(u, v)$
            end if
        end for

    return dist[ ], prev[ ]

GIS

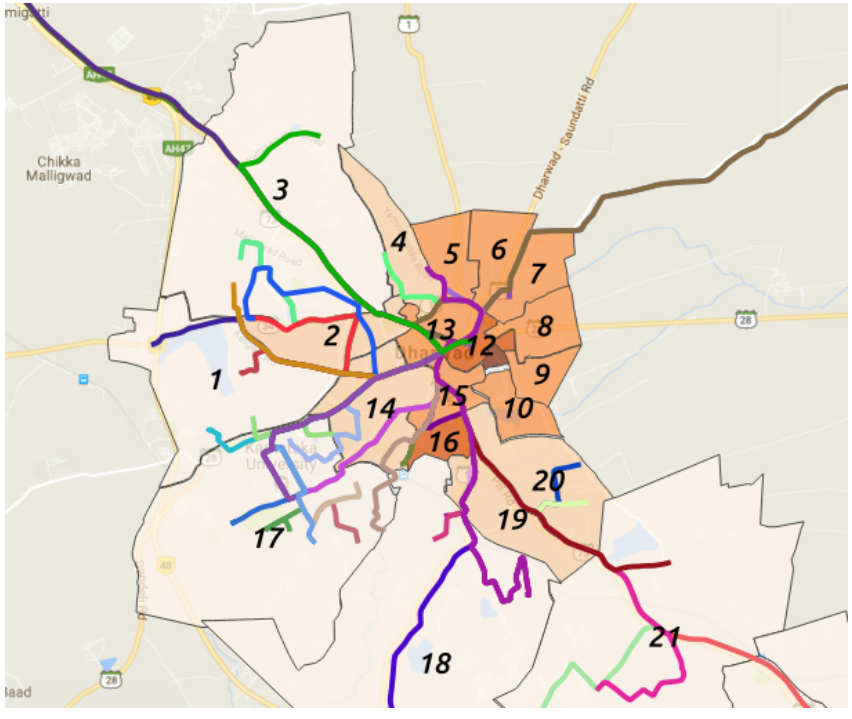

Figure: Ward map of Dharwad (classified by population density) superimposed on the bus network.

The way ahead...

- Implement a similar strategy in your town/taluka to generate a database.
- Scale the database over multiple talukas.
- Encourage addition of development course projects into the curriculum.
- There are other fields that need work also:
  Energy sector, public transport, more water, town planning,...
- See : www.ctara.iitb.ac.in for project ideas.
