

Some Computational Problems

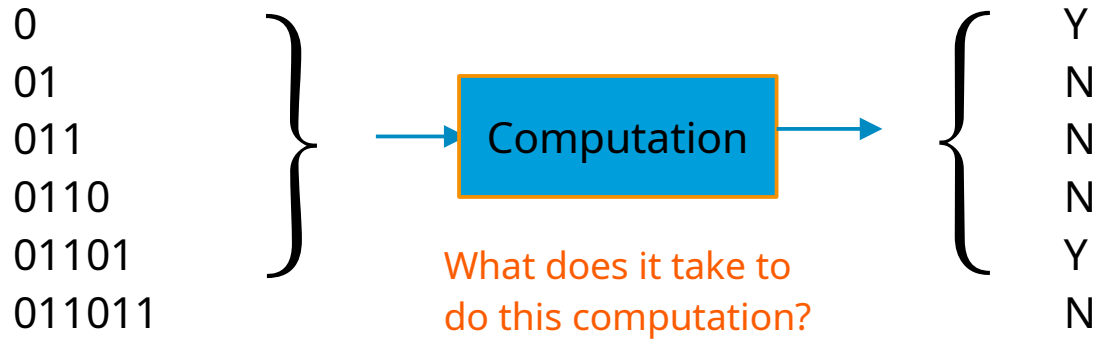

Supratik Chakraborty
Dept of CSE, IIT Bombay

Prob 1: Counting #1's modulo k

- Given a stream of 0's and 1's, output whether the count of 1's seen so far is a multiple of k
- Example: $k = 3$

Prob 1: Counting #1's modulo k

```
cm3 = 0; // cm3 : count of 1's mod 3
```

```
Repeat until no symbols to read  
Read next input symbol;
```

```
if (input == 1)  
    cm3 = (cm3 + 1) mod 3;
```

```
if (cm3 == 0) output Y  
else output N
```

Intuitive
„code“ view

„State transition“ (automata) view
Compact, mimics intuitive code view

Prob 2: Checking for product triple

- Given a stream of 0's, 1's and 2's in following format

$\underbrace{10100}_a \ 2 \ \underbrace{00100}_b \ 2 \ \underbrace{0001010000}_c$

- Output **Y** if $a \times b = c$ and **N** otherwise
- Assume a and b are always k bits long and c is $2k$ bits long
- Example, $k = 5$

$\underbrace{10100}_{a=20} \ 2 \ \underbrace{00100}_{b=4} \ 2 \ \underbrace{0001010000}_{c=80}$

Binary encoded numbers

Computation

Y

What does it take to
do this computation?

Prob 2: Checking for product triple

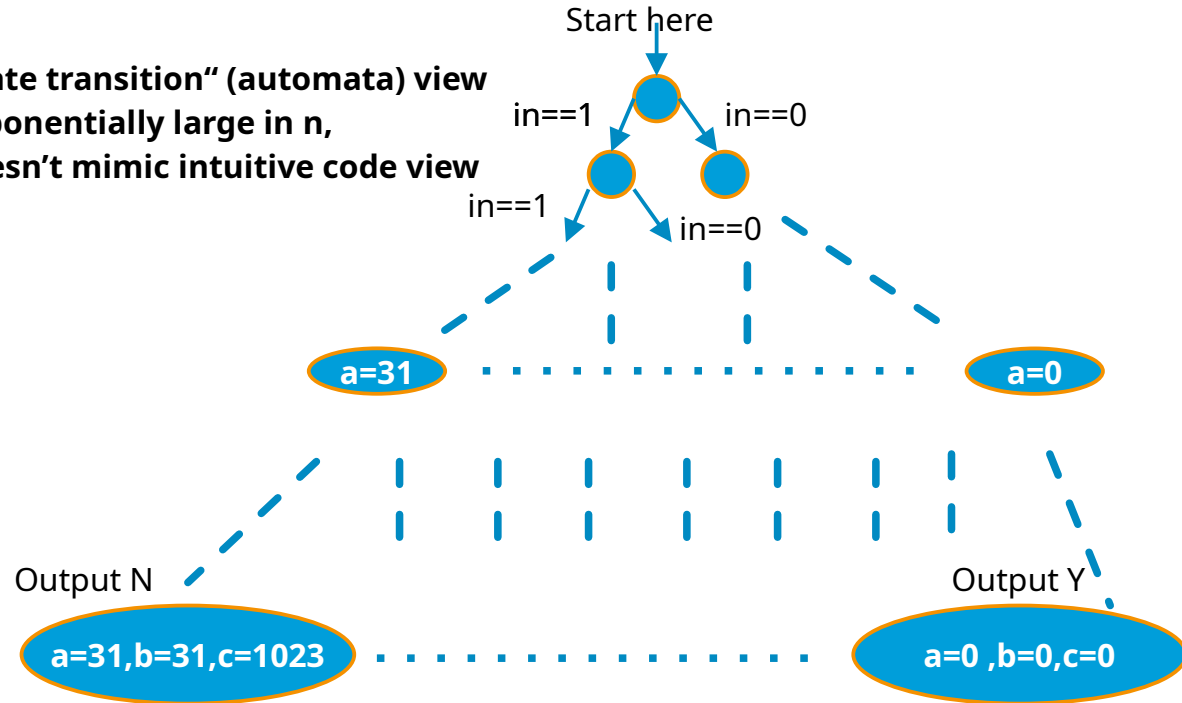

What does it take to do this computation?

Intuitive „code“ view

Read first k symbols;
Get value of a;
Read next k symbols after 2;
Get value of b;
Read next k symbols after 3;
Get value of c;

If $(a \times b == c)$ output Y
else output N

„State transition“ (automata) view
Exponentially large in n,
doesn't mimic intuitive code view

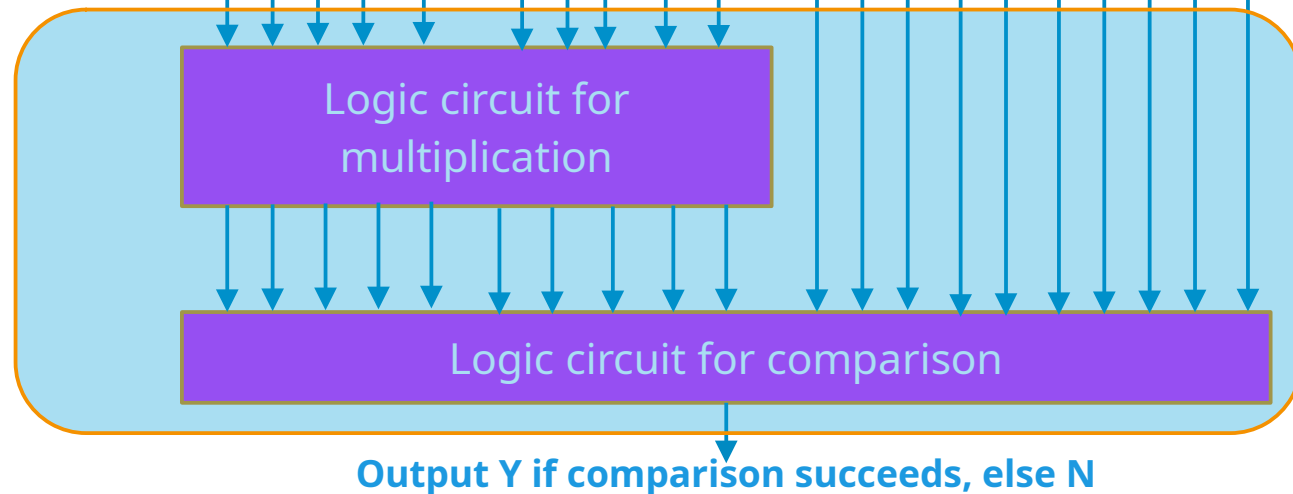

Prob 2: Checking for product triple

1 0 1 0 0 2 0 0 1 0 0 2 0 0 0 1 0 1 0 0 0 0

a₄ a₃ a₂ a₁ a₀ b₄ b₃ b₂ b₁ b₀ c₉ c₈ c₇ c₆ c₅ c₄ c₃ c₂ c₁ c₀

Entire circuit representable
by logic formula of size
quadratic in n , mimics
intuitive code view

Logic and Automata

- State transition centric view: Automata theory
- Logic formula centric view: Logical reasoning
- Both important, and also deeply connected
 - At times, it helps to view computation through lens of automata
 - See Prob 1 in earlier slides
 - At other times, through lens of logic
 - See Prob 2 in earlier slides
