# Green Scheduling

Ashutosh Trivedi

Department of Computer Science and Engineering,  
IIT Bombay

CS620: New Trends in IT: Modeling and Verification of Cyber-Physical Systems  
(26 July 2013)

# Peak Demand Reduction in Energy Usage

1. Absence of bulk energy storage technology
2. Base-load vs peaking power plants
3. Energy peaks are expensive:
  - For environment (peaking power plants are typically fossil-fueled )
  - For energy providers
  - For customers (peak power pricing)
4. Energy peaks are often avoidable:
  - Extreme weather and energy peaks
  - Heating, Ventilation, and Air-conditioning (HVAC) Units
5. Load-balancing methods:
  - Load shedding
  - Load shifting
  - Green scheduling [NBPM11]

# Green Scheduling

---

Zones \ HVAC Units Modes	HIGH	LOW	OFF
X (Temp. Change Rate/ Energy Usage)	-2/3	-1/2	2/0.2
Y (Temp. Change Rate/ Energy Usage)	-2/3	-1/2	3/0.2

# Green Scheduling

---

Zones \ HVAC Units Modes	HIGH	LOW	OFF
X (Temp. Change Rate/ Energy Usage)	-2/3	-1/2	2/0.2
Y (Temp. Change Rate/ Energy Usage)	-2/3	-1/2	3/0.2

- Assume that **comfortable temperature** range is  $65^{\circ}F$  to  $70^{\circ}F$ .
- Energy is extremely expensive if peak demand dips above 4 units in a billing period

# Green Scheduling

Zones \ HVAC Units Modes	HIGH	LOW	OFF
X (Temp. Change Rate/ Energy Usage)	-2/3	-1/2	2/0.2
Y (Temp. Change Rate/ Energy Usage)	-2/3	-1/2	3/0.2

- Assume that **comfortable temperature** range is  $65^{\circ}F$  to  $70^{\circ}F$ .
- Energy is extremely expensive if peak demand dips above 4 units in a billing period

## Problem

Find an “implementable” **switching schedule** that keeps the temperatures within **comfort zone** and **peak usage** within 4 units?

# Safe Schedulability Problem: Geometry

# Safe Schedulability Problem: Interior Case

## Lemma

Assume that the starting state lies in the *interior* of the safety set.  
A safe *non-Zeno* schedule exists if and only if

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0$$
$$\sum_{i=1}^{|M|} f_i = 1.$$

for some  $f_1, f_2, \dots, f_{|M|} \geq 0$ .

Moreover, such a schedule is *periodic*.

# Safe Schedulability Problem: Interior Case

---

Proof Sketch: (“if” direction):

If for some non-negative  $f_i$  we have

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0 \text{ and } \sum_{i=1}^{|M|} f_i = 1$$

then there exists a **non-Zeno periodic safe** schedule.

# Safe Schedulability Problem: Interior Case

---

Proof Sketch: (“if” direction):

If for some non-negative  $f_i$  we have

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0 \text{ and } \sum_{i=1}^{|M|} f_i = 1$$

then there exists a **non-Zeno periodic safe** schedule.

1. There exists a  $t > 0$  such that all modes are safe at  $s_0$  for  $t$ -time.
2. Consider the **periodic** schedule

$$(m_1, t \cdot f_1), (m_2, t \cdot f_2), \dots, (m_{|M|}, t \cdot f_{|M|})$$

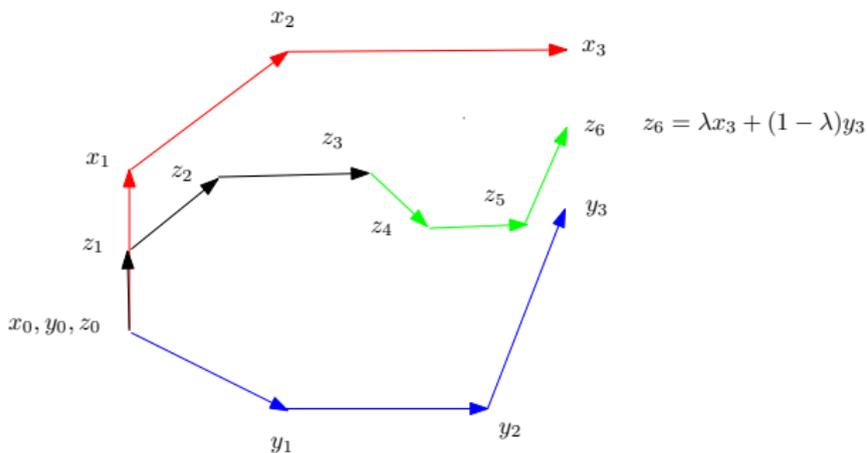

3. Notice that the schedule is **non-Zeno**.
4. Consider the trajectory of the schedule

$$s_0, (m_1, t_1), s_1(m_2, t_2), \dots, s_{|M|}, (m_1, t_1) \dots$$

5. Notice that  $s_{i \cdot |M| + j} = s_j$  for all  $i \geq 0$ .
6. We show that  $s_0, s_1, \dots, s_{|M|-1}$  are safe.

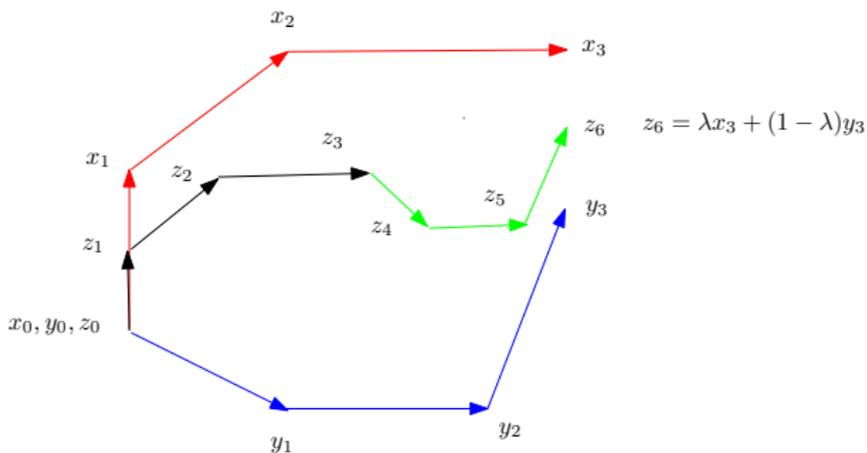

# Safe Schedulability Problem: “If” Direction

Lemma: All convex combinations of finite safe schedules are safe.

# Safe Schedulability Problem: “If” Direction

Lemma: All convex combinations of finite safe schedules are safe.

Corollary: All intermediate states visited in the following periodic schedule are safe if each mode is safe for time  $t > 0$ .

$$(m_1, t \cdot f_1), (m_2, t \cdot f_2), \dots, (m_{|M|}, t \cdot f_{|M|})$$

# Safe Schedulability Problem: Interior Case

---

Proof Sketch: (“only if” direction):

There exists a **non-Zeno periodic safe** schedule only if for some non-negative  $f_i$  we have

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0 \text{ and } \sum_{i=1}^{|M|} f_i = 1$$

# Safe Schedulability Problem: Interior Case

---

Proof Sketch: (“only if” direction):

There exists a **non-Zeno periodic safe** schedule only if for some non-negative  $f_i$  we have

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0 \text{ and } \sum_{i=1}^{|M|} f_i = 1$$

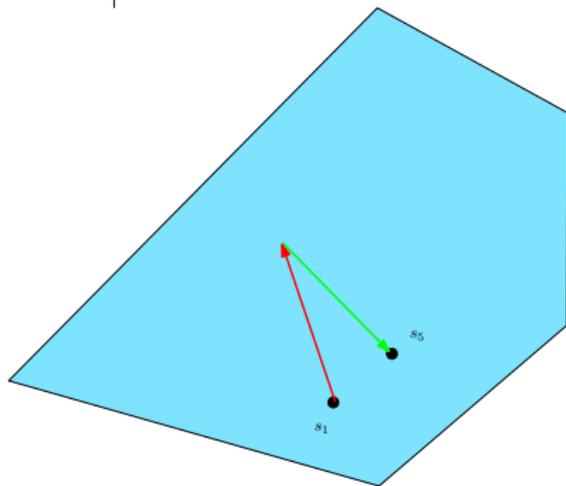

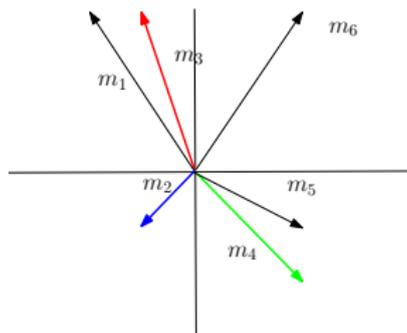

1. Assume that it is not **feasible**.
2. Then by **Farkas's lemma** there is  $(v_1, v_2, \dots, v_n) \in \mathbb{R}^n$  such that

$$(v_1, v_2, \dots, v_n) \cdot R(i) > 0 \text{ for all modes } i.$$

3. Taking any mode contributes to some progress in the direction  $(v_1, v_2, \dots, v_n)$
4. Any non-Zeno schedule will eventually leave the safety set.

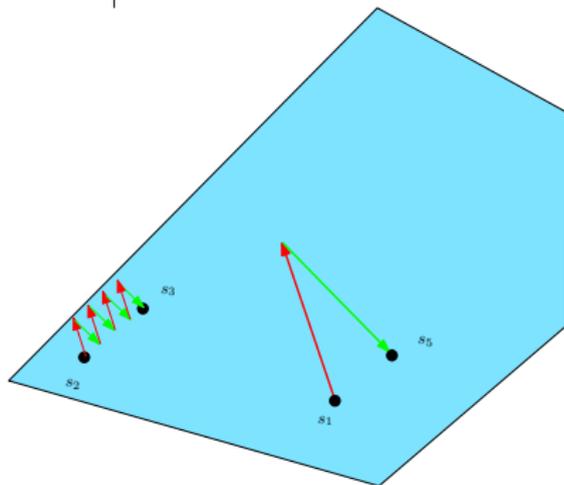

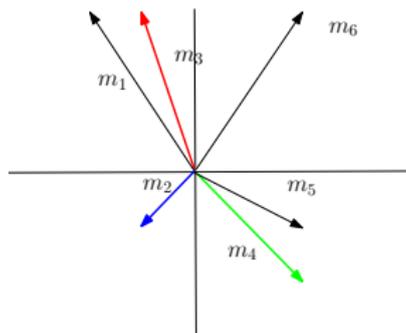

# Reachability Problem: Geometry

---

# Reachability Problem: Geometry

---

# Safe Reachability Problem

---

## Lemma

Assume that the *starting* state  $s_0$  and the *target* state  $s_t$  lie in the *interior* of the safety set.

A safe schedule exists from  $s_0$  to  $s_t$  exists if and only if

$$s_0 + \sum_{i=1}^{|M|} R(i) \cdot t_i = s_t$$

for some  $t_1, t_2, \dots, t_{|M|} \geq 0$ .

## Proof Sketch:

“Only if” direction is trivial.

# Safe Reachability Problem

---

Proof Sketch: (“if” direction):

If for some  $t_1, t_2, \dots, t_{|M|} \geq 0$  we have that

$$s_0 + \sum_{i=1}^{|M|} R(i) \cdot t_i = s_t$$

then a safe schedule exists from  $s_0$  to  $s_t$ .

1. There exists a  $t > 0$  such that all modes are safe at  $s_0$  and  $s_t$  for  $t$ -time.
2. Let  $\ell$  be a natural number greater than  $\frac{\sum_{i=1}^{|M|} t_i}{t}$ .
3. The periodic schedule  $(m_1, t_1/\ell), (m_2, t_2/\ell), \dots, (m_M, t_{|M|}/\ell)$  reaches the target in  $\ell \cdot |M|$  steps.
4. Each intermediate state is in the safety set.

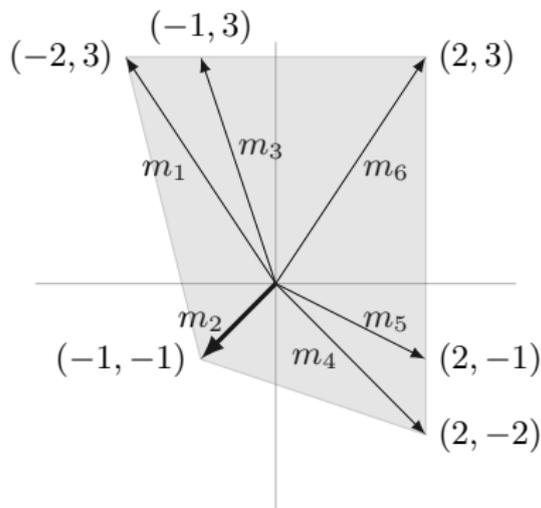

# Thumb Rules: Schedulability

The following is **feasible**:

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0 \text{ and } \sum_{i=1}^{|M|} f_i = 1$$

Or, the following is **infeasible**:

$$(v_1, v_2, \dots, v_n) \cdot R(i) > 0 \text{ for all modes } i.$$

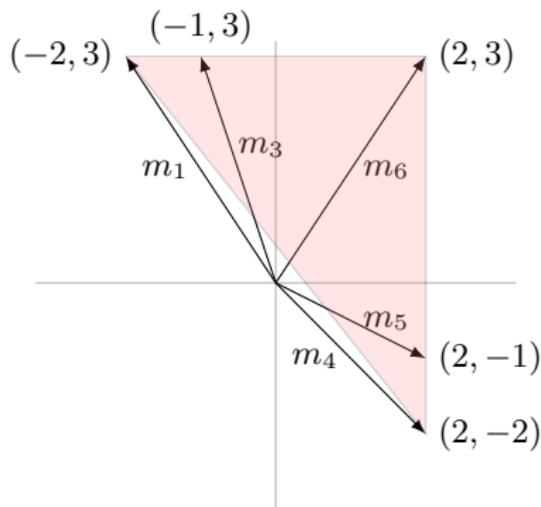

# Thumb Rules: Schedulability

The following is **feasible**:

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0 \text{ and } \sum_{i=1}^{|M|} f_i = 1$$

Or, the following is **infeasible**:

$$(v_1, v_2, \dots, v_n) \cdot R(i) > 0 \text{ for all modes } i.$$

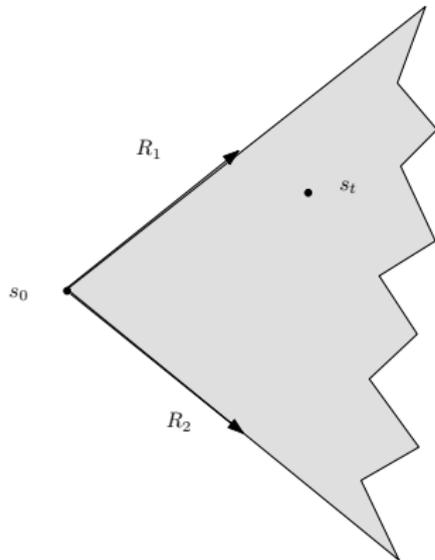

# Thumb Rules: Reachability

---

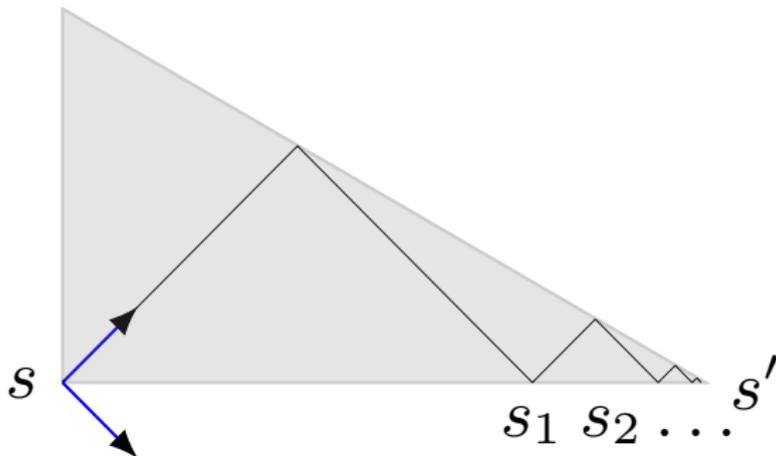

The following is **feasible**:

$$s_0 + \sum_{i=1}^{|M|} R(i) \cdot t_i = s_t$$

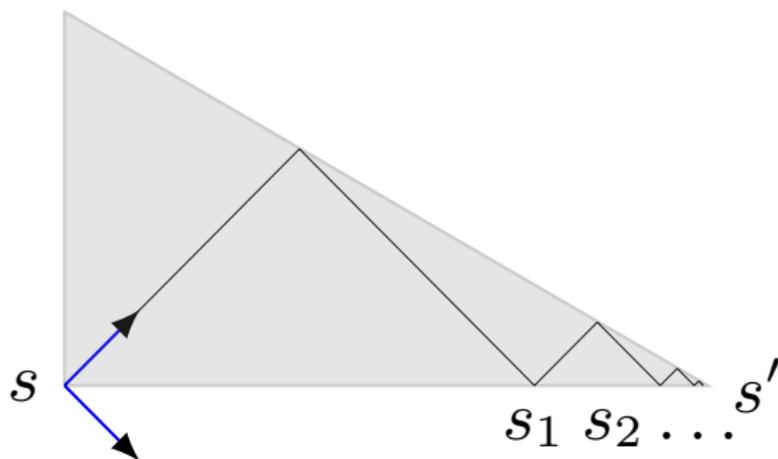

# Reachability: Boundary Case

---

# Reachability: Boundary Case

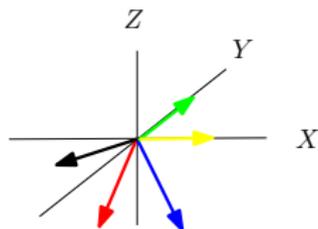

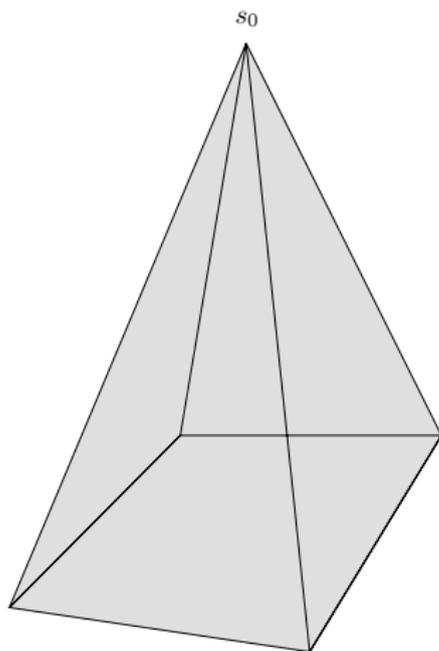

---

1. Rate vectors are  $(1, 1)$  and  $(1, -1)$
2. Angle at  $s'$  is  $30^\circ$ .
3.  $\|s_k, s\| = \|s, s'\| \cdot \left(\frac{\sqrt{3}-1}{\sqrt{3}+1}\right)^k$ .

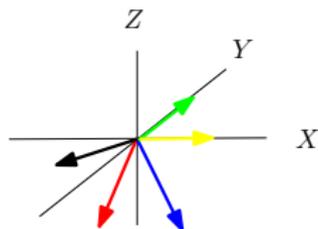

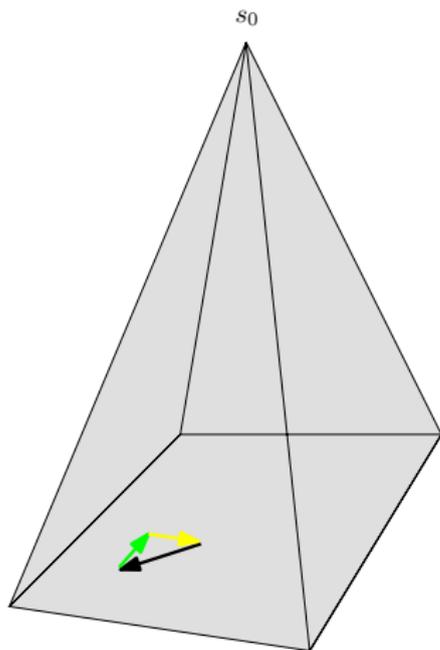

# Schedulability: Boundary Case

## Lemma

*For any finite safe schedule  $\sigma$  there exists a finite safe schedule  $\sigma'$  s.t.:*

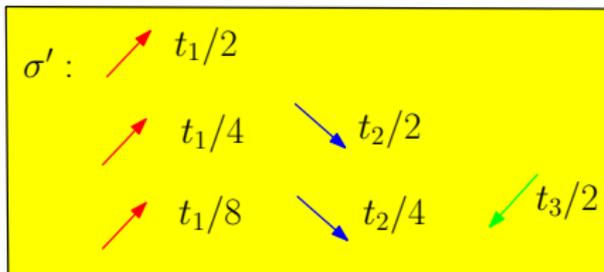

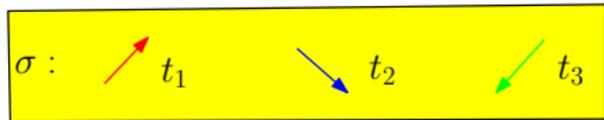

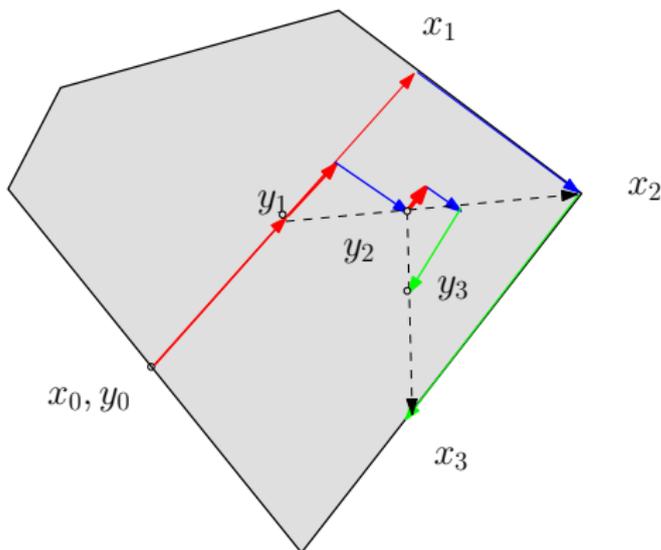

- 1. All modes that were ever safe during the trajectory with  $\sigma$  will be safe in the final state of  $\sigma'$ , and*
- 2. The set of safe modes in every state of  $\sigma'$  will always be increasing.*

# Schedulability: Boundary Case

## Lemma

For any finite safe schedule  $\sigma$  there exists a finite safe schedule  $\sigma'$  s.t.:

1. All modes that were ever safe during the trajectory with  $\sigma$  will be safe in the final state of  $\sigma'$ , and
2. The set of safe modes in every state of  $\sigma'$  will always be increasing.

# Algorithm: Interior Case

---

1. Compute the sequence of set of modes  $M_1, M_2, \dots, M_k$  such that
  - $M_1$  is the set of safe modes at  $x_0$ , and
  - $M_i$  is the set of safe modes at states reachable from  $x_0$  using only modes from  $M_{i-1}$ .
2.  $M_1 \subset M_2 \subset \dots \subset M_k$ .
3. Modes outside  $M_k$  are never reachable from  $x_0$ .
4. The set  $M_k$  can be computed in polynomial time.
5. MMS is schedulable from  $x_0$  if and only if:

$$\sum_{m \in M_k} R(m) \cdot f_m = 0 \text{ and } \sum_{m \in M_k} f_m = 1$$

6. That can, again, be checked in polynomial time.

Motivation

Constant-Rate Multi-Mode Systems

Optimization, Discretization, and Undecidability

Conclusion

# Optimization Schedulability and Reachability

---

- MMS  $\mathcal{H} = (M, n, R)$  and price function  $\pi : M \rightarrow \mathbb{R}$

$$\limsup_{n \rightarrow \infty} \frac{\sum_{i=1}^k \pi(m_i) t_i}{\sum_{i=1}^k t_i}.$$

- Optimal reachability-price and average-price problems
- Minimize  $\sum_{i=1}^{|M|} t_i \cdot \pi(m_i)$  subject to:

$$s_0 + \sum_{i=1}^{|M|} R(i) \cdot t_i = s_t, \text{ and } t_i \geq 0.$$

- Minimize  $\sum_{i=1}^{|M|} f_i \cdot \pi(m_i)$  subject to:

$$\sum_{i=1}^{|M|} R(i) \cdot f_i = 0 \text{ and } \sum_{i=1}^{|M|} f_i = 1, f_i \geq 0.$$

# Discrete Schedulability and Undecidability

---

Discrete Schedulability:

- Requiring schedules with delays that are multiples of a given **sampling rate**
- For a **bounded** safety set only a finite number of states reachable using such discrete schedulers.
- Such reachable state-transition graph is of **exponential size**.
- schedulability/optimization problems can be solved in PSPACE.
- We show PSPACE-hardness by a reduction from acceptance problem for **linear-bounded automata**.

# Discrete Schedulability and Undecidability

---

## Discrete Schedulability:

- For a **bounded** safety set only a finite number of states reachable using such discrete schedulers.
- Such reachable state-transition graph is of **exponential size**.
- schedulability/optimization problems can be solved in PSPACE.
- We show PSPACE-hardness by a reduction from acceptance problem for **linear-bounded automata**.

## Generalizations:

- One can add some **structure** to the system by adding
  - **guards** on mode-switches
  - mode-dependent **invariants**
- Corresponds to **singular hybrid automata** of Henzinger et al. [HKPV98]
- We show that both generalizations lead to **undecidability** of the reachability problem.

Motivation

Constant-Rate Multi-Mode Systems

Optimization, Discretization, and Undecidability

Conclusion

# Summary and Future Work

---

## Summary:

1. Proposed a model for **constant-rate multi-mode systems**
2. **Polynomial-time algorithms** for safe schedulability and safe reachability
3. **Energy peak demand reduction** problem
4. **Discrete schedulers** lead to PSPACE-hardness
5. Adding either **local invariants** or **guards** lead to undecidability

## Future work:

1. Bounded-rate multi-mode systems
2. Optimization problems with cost of mode-switches
3. Extension with clock variables with guards and local-invariants
