IIT Bom

Copyright

These slides constitute the lecture notes for CS618 Program Analysis course at IIT Bombay and have been made available as teaching material accompanying the book:

• Uday Khedker, Amitabha Sanyal, and Bageshri Karkare. *Data Flow Analysis: Theory and Practice.* CRC Press (Taylor and Francis Group). 2009.

(Indian edition published by Ane Books in 2013)

Apart from the above book, some slides are based on the material from the following books

- A. V. Aho, M. Lam, R. Sethi, and J. D. Ullman. *Compilers: Principles, Techniques, and Tools.* Addison-Wesley. 2006.
- M. S. Hecht. *Flow Analysis of Computer Programs*. Elsevier North-Holland Inc. 1977.

These slides are being made available under GNU FDL v1.2 or later purely for academic or research use.

Motivating the Need of Program Analysis

- Some representative examples
 - Classical optimizations performed by compilers
 - Optimizing heap memory usage
- Course details, schedule, assessment policies etc.
- Program Model
- Soundness and Precision

Part 2

Classical Optimizations

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

Examples of Optimising Transformations (ALSU, 2006)

A C program and its optimizations

```
void quicksort(int m, int n)
\{ int i, j, v, x;
   if (n \le m) return;
   i = m-1; j = n; v = a[n];
                                               /\star v is the pivot \star/
   while(1)
                                        /* Move values smaller */
    { do i = i + 1; while (a[i] < v); /* than v to the left of */
       do i = j - 1; while (a[j] > v); /* the split point (sp) */
       if (i \ge i) break;
                                            /* and other values */
       x = a[i]; a[i] = a[i]; a[i] = x;
                                           /* to the right of sp */
                                            /* of the split point */
   x = a[i]; a[i] = a[n]; a[n] = x; /* Move the pivot to sp */
   quicksort(m,i); quicksort(i+1,n); /* sort the partitions to */
          /* the left of sp and to the right of sp independently \star/
```

Intermediate Code

For the boxed source code

	$egin{array}{lll} {\sf i}={\sf m} \ {\sf -1} \ {\sf j}={\sf n} \end{array}$
3.	t1 = 4 * n
4.	t6 = a[t1]
5.	v = t6
6.	i = i + 1
7.	t2 = 4 * i
8.	t3 = a[t2]
9.	if t3 $<$ v goto 6
10.	j = j - 1
11.	t4 = 4 * j

12.	t5 = a[t4]
13.	if t5 $>$ v goto 10
14.	if $i >= j \ \text{goto} \ 25$
15.	t2 = 4 * i
16.	t3 = a[t2]
	x = t3
18.	t2 = 4 * i
19.	t4 = 4 * j
20.	t5 = a[t4]
21.	a[t2] = t5
22.	t4 = 4 * j

23. a[t4] = x24. goto 6 25. t2 = 4 * i 26. t3 = a[t2]27. x = t3 28. t2 = 4 * i 29. t1 = 4 * n 30. t6 = a[t1]31. a[t2] = t632. t1 = 4 * n 33. a[t1] = x

Intermediate Code : Observations

- Multiple computations of expressions
- Simple control flow (conditional/unconditional goto) Yet undecipherable!
- Array address calculations

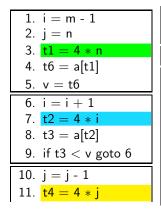

Understanding Control Flow

- Identify maximal sequences of linear control flow
 ⇒ Basic Blocks
- No transfer into or out of basic blocks except the first and last statements Control transfer into the block : only at the first statement.
 Control transfer out of the block : only at the last statement.

Intermediate Code with Basic Blocks

12.
$$t5 = a[t4]$$

13. if $t5 > v$ goto 10
14. if $i >= j$ goto 25
15. $t2 = 4 * i$
16. $t3 = a[t2]$
17. $x = t3$
18. $t2 = 4 * i$
19. $t4 = 4 * j$
20. $t5 = a[t4]$
21. $a[t2] = t5$
22. $t4 = 4 * j$

23.
$$a[t4] = x$$

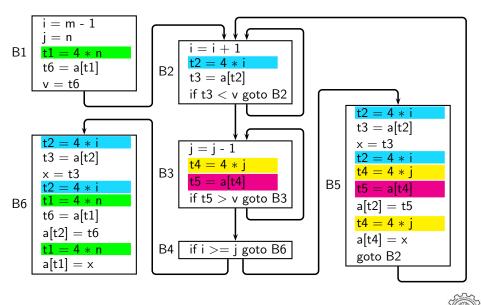

24. goto 6
25. $t2 = 4 * i$
26. $t3 = a[t2]$
27. $x = t3$
28. $t2 = 4 * i$
29. $t1 = 4 * n$
30. $t6 = a[t1]$
31. $a[t2] = t6$
32. $t1 = 4 * n$
33. $a[t1] = x$

Nesting Level	No. of Statements	
	Original	Optimized
0	14	10
1	11	4
2	8	6

If we assume that a loop is executed 10 times, then the number of computations saved at run time $% \left({{{\rm{T}}_{\rm{T}}}} \right)$

$$=(14-10)+(11-4) imes 10+(8-6) imes 10^2=4+70+200=274$$

Observations

- Optimizations are transformations based on some information.
- Systematic analysis required for deriving the information.
- We have looked at data flow optimizations.
 Many control flow optimizations can also be performed.

Categories of Optimizing Transformations and Analyses

Code Motion Redundancy Elimination Control flow Optimization	Machine Independent	Flow Analysis (Data + Control)
Loop Transformations	Machine Dependent	Dependence Analysis (Data + Control)
Instruction Scheduling Register Allocation Peephole Optimization	Machine Dependent	Several Independent Techniques
Vectorization Parallelization	Machine Dependent	Dependence Analysis (Data + Control)

Discovering information about a given program

Discovering information about a given program

• Representing the dynamic behaviour of the program

Discovering information about a given program

- Representing the dynamic behaviour of the program
- Most often obtained without executing the program
 - Static analysis Vs. Dynamic Analysis
 - Example of loop tiling for parallelization

Discovering information about a given program

- Representing the dynamic behaviour of the program
- Most often obtained without executing the program
 - Static analysis Vs. Dynamic Analysis
 - Example of loop tiling for parallelization
- Must represent all execution instances of the program

Why is it Useful?

- Code optimization
 - Improving time, space, energy, or power efficiency
 - Compilation for special architecture (eg. multi-core)

22/64

Why is it Useful?

- Code optimization
 - Improving time, space, energy, or power efficiency
 - Compilation for special architecture (eg. multi-core)
- Verification and validation

Giving guarantees such as: The program will

- never divide a number by zero
- never dereference a NULL pointer
- close all opened files, all opened socket connections
- not allow buffer overflow security violation

22/64

Part 3

Optimizing Heap Memory Usage

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 の々で

Standard Memory Architecture of Programs

Heap allocation provides the flexibility of

• Variable Sizes. Data structures can grow or shrink as desired at runtime.

(Not bound to the declarations in program.)

• *Variable Lifetimes.* Data structures can be created and destroyed as desired at runtime.

(Not bound to the activations of procedures.)

Managing Heap Memory

Decision 1: When to Allocate?

- Explicit. Specified in the programs. (eg. Imperative/OO languages)
- Implicit. Decided by the language processors. (eg. Declarative Languages)

Managing Heap Memory

Decision 1: When to Allocate?

- Explicit. Specified in the programs. (eg. Imperative/OO languages)
- Implicit. Decided by the language processors. (eg. Declarative Languages)

Decision 2: When to Deallocate?

- Explicit. Manual Memory Management (eg. C/C++)
- Implicit. Automatic Memory Management aka Garbage Collection (eg. Java/Declarative languages)

State of Art in Manual Deallocation

• Memory leaks

10% to 20% of last development effort goes in plugging leaks

Tool assisted manual plugging

Purify, Electric Fence, RootCause, GlowCode, yakTest, Leak Tracer, BDW Garbage Collector, mtrace, memwatch, dmalloc etc.

- All leak detectors
 - are dynamic (and hence specific to execution instances)
 - generate massive reports to be perused by programmers
 - usually do not locate last use but only allocation escaping a call At which program point should a leak be "plugged"?

Garbage Collection \equiv Automatic Deallocation

- Retain active data structure.
 Deallocate inactive data structure.
- What is an Active Data Structure?

Garbage Collection \equiv Automatic Deallocation

- Retain active data structure. Deallocate inactive data structure.
- What is an Active Data Structure?

If an object does not have an access path, (i.e. it is unreachable) then its memory can be reclaimed.

Garbage Collection \equiv Automatic Deallocation

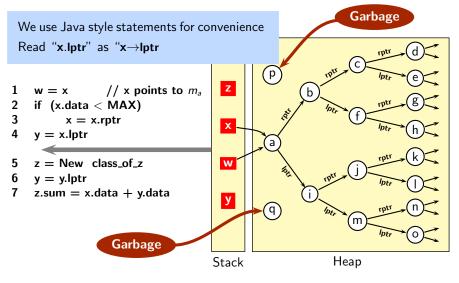

- Retain active data structure.
 Deallocate inactive data structure.
- What is an Active Data Structure?

If an object does not have an access path, (i.e. it is unreachable) then its memory can be reclaimed.

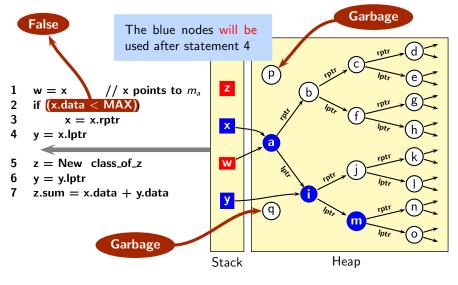

What if an object has an access path, but is not accessed after the given program point?

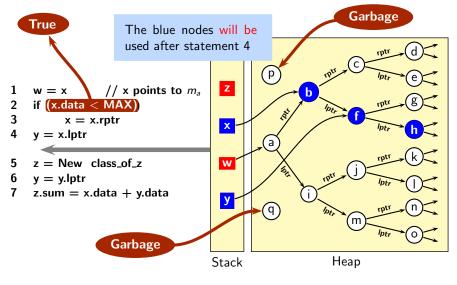

IIT Bombay

IIT Bombay

Is Reachable Same as Live?

From www.memorymanagement.org/glossary

live (also known as alive, active) : Memory(2) or an object is live if the program will read from it in future. *The term is often used more broadly to mean reachable.*

It is not possible, in general, for garbage collectors to determine exactly which objects are still live. Instead, they use some approximation to detect objects that are provably dead, *such as those that are not reachable*.

Similar terms: reachable. Opposites: dead. See also: undead.

Is Reachable Same as Live?

• Not really. Most of us know that.

Even with the state of art of garbage collection, 24% to 76% unused memory remains unclaimed

• The state of art compilers, virtual machines, garbage collectors cannot distinguish between the two

Reachability and Liveness

Comparison between different sets of objects:

Live ? Reachable ? Allocated

Reachability and Liveness

Comparison between different sets of objects:

 $\mathsf{Live} \ \subseteq \ \mathsf{Reachable} \ \subseteq \ \mathsf{Allocated}$

Reachability and Liveness

Comparison between different sets of objects:

 $\mathsf{Live} \ \subseteq \ \mathsf{Reachable} \ \subseteq \ \mathsf{Allocated}$

The objects that are not live must be reclaimed.

Reachability and Liveness

Comparison between different sets of objects:

$$\mathsf{Live} \subseteq \mathsf{Reachable} \subseteq \mathsf{Allocated}$$

The objects that are not live must be reclaimed.

 \neg Live ? \neg Reachable ? \neg Allocated

Reachability and Liveness

Comparison between different sets of objects:

$$\mathsf{Live} \subseteq \mathsf{Reachable} \subseteq \mathsf{Allocated}$$

The objects that are not live must be reclaimed.

 $\neg \mathsf{Live} \ \supseteq \ \neg \mathsf{Reachable} \ \supseteq \ \neg \mathsf{Allocated}$

Reachability and Liveness

Comparison between different sets of objects:

$$\mathsf{Live} \subseteq \mathsf{Reachable} \subseteq \mathsf{Allocated}$$

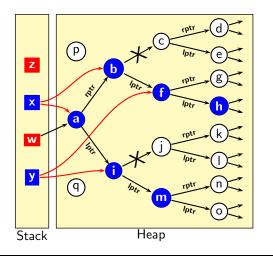

The objects that are not live must be reclaimed.

$$\neg \text{ Live } \supseteq \neg \text{ Reachable } \supseteq \neg \text{ Allocated}$$
Garbage collectors

Cedar Mesa Folk Wisdom

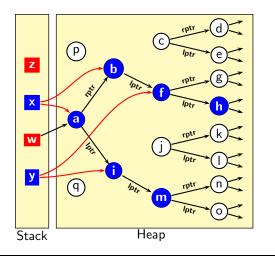

Make the unused memory unreachable by setting references to NULL. (GC FAQ: http://www.iecc.com/gclist/GC-harder.html)

IIT Bombay

Cedar Mesa Folk Wisdom

Make the unused memory unreachable by setting references to NULL. (GC FAQ: http://www.iecc.com/gclist/GC-harder.html)

July 2018

IIT Bombay

Cedar Mesa Folk Wisdom

- Most promising, simplest to understand, yet the hardest to implement.
- Which references should be set to NULL?
 - Most approaches rely on feedback from profiling.
 - No systematic and clean solution.

Distinguishing Between Reachable and Live

The state of art

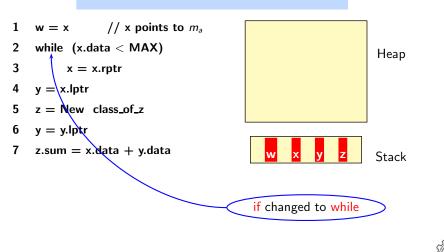

- Eliminating objects reachable from root variables which are not live.
- Implemented in current Sun JVMs.
- Uses liveness data flow analysis of root variables (stack data).
- What about liveness of heap data?

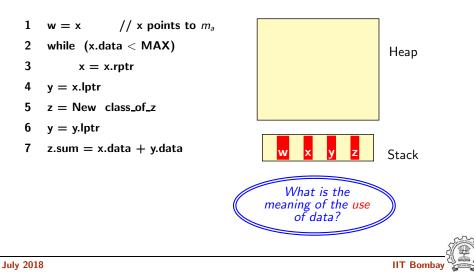

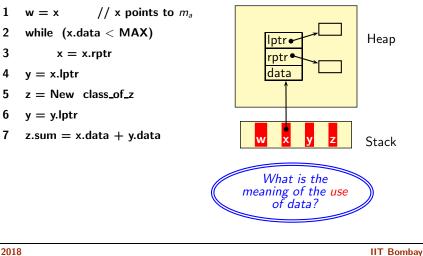

IIT Bombay

Liveness of Stack Data: An Informal Introduction (1)

We use Java style statements for convenience Read "x.lptr" as "x \rightarrow lptr

IIT Bombay

Intro to PA: Optimizing Heap Memory Usage Liveness of Stack Data: An Informal Introduction (1) Accessing the location and reading its contents 1 // x points to m_a w = xwhile (x.data < MAX)2 Heap lptr • 3 x = x.rptrrptr • data 4 y = x.lptr5 $z = New class_of_z$ 6 y = y.lptr7 z.sum = x.data + y.dataStack What is the meaning of the use of data?

- Current value of x is used beyond this program point
- There are two control flow paths beyond this program point

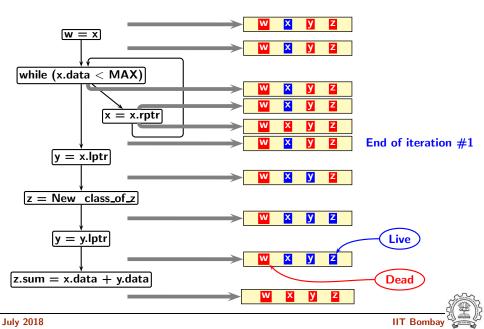

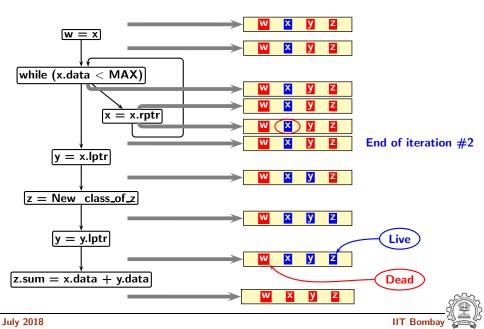

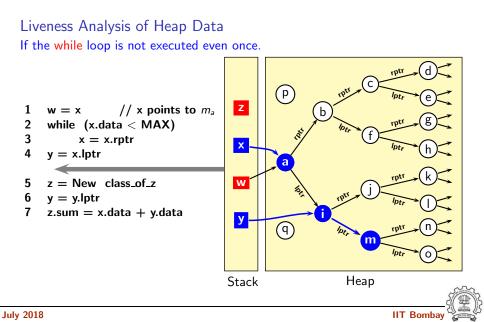

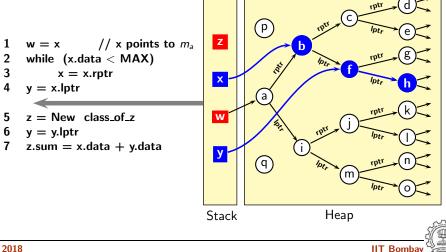

Applying Cedar Mesa Folk Wisdom to Heap Data

Applying Cedar Mesa Folk Wisdom to Heap Data

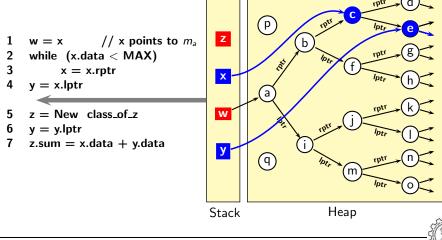

Liveness Analysis of Heap Data If the while loop is executed once.

IIT Bombav

Applying Cedar Mesa Folk Wisdom to Heap Data

Liveness Analysis of Heap Data If the while loop is executed twice.

The Moral of the Story

- Mappings between access expressions and I-values keep changing
- This is a *rule* for heap data For stack and static data, it is an *exception*!
- Static analysis of programs has made significant progress for stack and static data.

What about heap data?

- Given two access expressions at a program point, do they have the same l-value?
- Given the same access expression at two program points, does it have the same l-value?

Sequence of Generalizations in the Course Modules

Course Pedagogy

- Interleaved lectures and tutorials
- Plenty of problem solving
- Practice problems will be provided,
 - Ready-made solutions will not be provided
 - Your solutions will be checked
- Detailed course plan can be found at the course page: http://www.cse.iitb.ac.in/~uday/courses/cs618-18/
- Moodle will be used extensively for announcements and discussions

Assessment Scheme

• Tentative plan

Mid Semester Examination	30%
End Semester Examination	45%
Two Quizzes	10%
Project	15%
Total	100%

• Can be fine tuned based on the class feedback

Course Strength and Selection Criteria

- Less than 30 is preferable, 40 is tolerable At the moment no plan of restricting the registration
- Course primarily aimed at M.Tech. 1 students Follow up course and MTPs

Questions ??

Program Model

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Program Representation

- Three address code statements
 - Result, operator, operand1, operand2
 - Assignments, expressions, conditional jumps
 - Initially only scalars
 Pointers, structures, arrays modelled later
- Control flow graph representation
 - Nodes represent maximal groups of statements devoid of any control transfer except fall through
 - Edges represent control transfers across basic blocks
 - A unique Start node and a unique End node Every node reachable from Start, and End reachable from every node
- Initially only intraprocedural programs Function calls brought in later

An Example Program

```
int main()
{ int a, b, c, n;
  a = 4;
  b = 2;
  c = 3;
  n = c*2;
  while (a <= n)
  ſ
    a = a+1;
  }
  if (a < 12)
    a = a+b+c;
   return a;
}
```

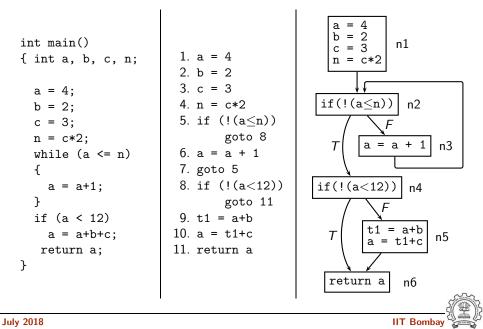

An Example Program

```
int main()
{ int a, b, c, n;
 a = 4;
  b = 2;
  c = 3;
 n = c*2;
  while (a <= n)
  ſ
    a = a+1;
 }
  if (a < 12)
    a = a+b+c;
   return a;
}
```

```
1. a = 4
2. b = 2
3. c = 3
4. n = c*2
5. if (!(a≤n))
       goto 8
6. a = a + 1
7. goto 5
8. if (!(a<12))
       goto 11
9. t1 = a+b
10. a = t1+c
11. return a
```

An Example Program

Part 6

Requirements of Static Analysis

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

Important Requirements of Static Analysis

- We discuss the following important requirements
 - Soundness
 - Precision
 - Efficiency
 - Scalability
- Soundness and precision are described more formally later in module 2

Inexactness of Static Analysis Results

- Static analyis predicts run time behaviour of programs
- Static analysis is undecidable
 - there cannot exist an algorithm that can compute
 - exact result for every program
- Possible reasons of undecidability
 - Values of variables not known
 - Branch outcomes not known
 - Infinitely many paths in the presence of loops or recursion
 - Infinitely many values
- Static analysis predictions may not match the actual run time behaviour

Possible Errors in Static Analysis Predictions

- Some predictions may be erroneous because the predicted behaviour
 - may not be found in some execution instances, or
 - may not be found in any execution instance

(Error \equiv Mismatch between run time behaviour and predicted behaviour)

- Some of these errors may be harmless whereas some may be harmful
- Some of these errors may be unavoidable (recall undecidability)
- How do we characterize, identify, and minimize, these errors?

Examples of Harmless and Harmful Errors in Predictions (1)

- For security check at an airport,
 - Frisking a person more than others on mere suspicion may be an error but it is harmless from the view point of security
 - Not frisking a person much even after a suspicion is an error and it could be a harmful from the view point of security
- For stopping smuggling of contraband goods
 - Not checking every passenger may be erroneous but is harmless
 - Checking every passenger may be right but is harmful
- Weather prediction during rainy season
 - ► A doubtful prediction of "heavy to very heavy rain" is harmless
 - Not predicting "heavy to very heavy rain" could be harmful

Examples of Harmless and Harmful Errors in Predictions (2)

- For medical dignosis
 - Subjecting a person to further investigations may be erroneous but in most cases it is harmless
 - Avoding further investigations even after some suspicions could be harmful
- For establishing justice in criminal courts
 - Starting with the assumption that an accused is innocent may be erroneous but is harmless
 - Starting with the assumption that an accused is guilty may be harmful

Harmless Errors and Harmful Errors in Static Analysis

- For a static analysis,
 - Harmless errors can be tolerated but should be minimized Precision
 - Harmful errors MUST be avoided
- Some behaviours concluded by a static analysis are
 - uncertain and cannot be guaranteed to occur at run time, (This uncertainty is harmless and hence is conservative)
 - certain and can be guaranteed to occur at run time (The absence of this certainty for these behaviours may be harmful)

Soundness

Examples of Conservative and Definite Information

• Liveness is uncertain (also called conservative)

If a variable is declared live at a program point, it may or may not be used beyond that program point at run time

(Why is it harmless if the variable is not actually used?)

• Deadness (i.e. absence of liveness) is certain (also called definite)

If a variable is declared to be dead at a program point, it is guaranteed to be not used beyond that program point at run time

(Why is it harmful if the variable is not actually dead?)

	Hypothesis Accepted	Hypothesis Rejected	
Hypothesis holds	True Positive	False Negative	
Hypothesis does not hold	False Positive	True Negative	

	Hypothesis Accepted	Hypothesis Rejected
Hypothesis holds	True Positive	False Negative
Hypothesis does not hold	False Positive	True Negative

	Hypothesis Accepted	Hypothesis Rejected	
Hypothesis holds	True Positive	False Negative	
Hypothesis does not hold	False Positive	True Negative	

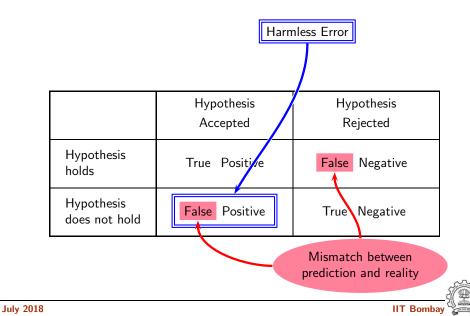

IIT Bombay

$\{$ **True**, **False** $\} \times \{$ **Positive**, **Negative** $\}$

	Hypothesis Accepted	Hypothesis Rejected	
Hypothesis holds	True Positive False Negative		
Hypothesis does not hold	False Positive True Negative		
No mismatch between prediction and reality			

	Hypothesis Accepted	Hypothesis Rejected	
Hypothesis holds	True Positive	False Negative	
Hypothesis does not hold	False Positive	True Negative	
		Mismatch between prediction and reality

Hypothesis: A patient IS suffering from Malaria

Hypothesis: A patient IS suffering from Malaria

Hypothesis: A patient IS suffering from Malaria

Hypothesis: A patient IS suffering from Malaria

Hypothesis: A patient IS suffering from Malaria

The Role of How a Hypothesis is Framed (1)

• The following association critically depends on how a hypothesis is framed

- ► False Positive ≡ Imprecise
- ► False Negative ≡ Unsound
- In some cases, the hypothesis involves a negation

For hearing a criminal case, a court begins with the hypothesis *The accused is NOT guilty*

If a court chooses the non-negated hypothesis An accused IS guilty then

- False Positive \equiv Imprecise Unsound
- False Negative \equiv Unsound Imprecise

The Role of How a Hypothesis is Framed (2)

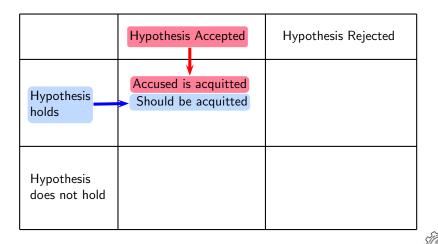

Default hypothesis in criminal proceedings: An accused IS NOT guilty

	Hypothesis Accepted	Hypothesis Rejected
Hypothesis holds		
Hypothesis does not hold		

July 2018

The Role of How a Hypothesis is Framed (2)

IIT Bombay

The Role of How a Hypothesis is Framed (2)

The Role of How a Hypothesis is Framed (2)

Default hypothesis in criminal proceedings: An accused IS NOT guilty

	Hypothesis	Accepted	Hypothesis Rejected
Hypothesis holds		acquitted acquitted	Accused is sentenced Should be acquitted
Hypothesis does not hold	Accused is Should be	acquitted sentenced	

IIT Bomba

The Role of How a Hypothesis is Framed (2)

Default hypothesis in criminal proceedings: An accused IS NOT guilty

	Hypothesis Accepted	Hypothesis Rejected
Hypothesis	Accused is acquitted	Accused is sentenced
holds	Should be acquitted	Should be acquitted
Hypothesis	Accused is acquitted	Accused is sentenced
does not hold	Should be sentenced	Should be sentenced

July 2018

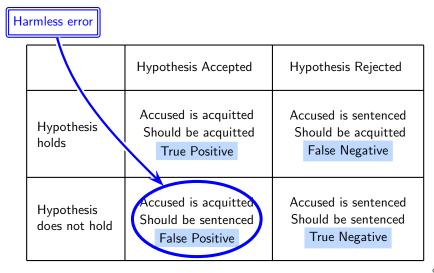

The Role of How a Hypothesis is Framed (2)

	Hypothesis Accepted	Hypothesis Rejected
Hypothesis holds	Accused is acquitted Should be acquitted True Positive	Accused is sentenced Should be acquitted False Negative
Hypothesis does not hold	Accused is acquitted Should be sentenced False Positive	Accused is sentenced Should be sentenced True Negative

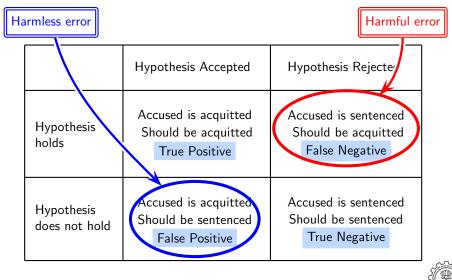

IIT Bombay

The Role of How a Hypothesis is Framed (2)

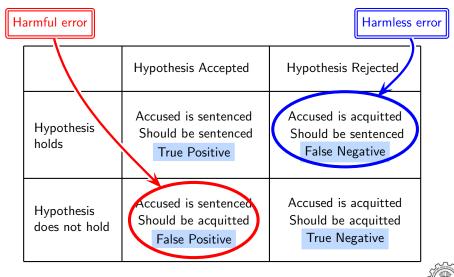

The Role of How a Hypothesis is Framed (2)

The Role of How a Hypothesis is Framed (3)

Assume the non-negated hypothesis: An accused IS guilty

Efficiency and Scalability

• Efficiency

- How well are resources used
- Measured in terms of work done per unit resource
- ► Resources: time, memory, power, energy, processors, network etc.
- Example: Strike rate of a batter in cricket

Scalability

- How large inputs can be handled
- Measured in terms of size of the input
- Example: Total runs scored by a batter in cricket
- Efficiency and scalability are orthogonal
 - Efficiency does not necessarily imply scalability
 - Scalability does not necessarily imply efficiency

Efficiency and Scalability May be Unrelated

Examples of the combinations of efficiency and scalability from sorting algorithms

	Efficient	Inefficient
Scalable	Merge Sort	Selection Sort
Non-scalable	Quicksort	Bubble Sort

Practical Static Analysis

- The goodness of a static analysis lies in minimizing imprecision without compromising on soundness
 Additional expectations: Efficiency and scalability
- Some applications (e.g. debugging) do not need to cover all traces Ex: Traffic police catching people for traffic violations
- Some features of a programming language may not be covered (e.g. "eval" in Javascript, aliasing of array indices, effect of libraries)
- Accept a "soundy" analysis [Liveshits et. al. CACM 2015] OR

Tolerate imprecision for complete soundness
