Commands to Obtain the Low Level Abstraction

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- Write the program and name the file `fact-iterative.cc`
- `g++ fact-iterative.cc` produces the executable in `a.out` file
- `strip a.out` removes names from the executable `a.out`
- `file a.out` produces the following output

```
a.out: ELF 64-bit LSB shared object, x86-64, version 1
(SYSV), dynamically linked, interpreter
/lib64/ld-linux-x86-64.so.2,
BuildID[sha1]=0c218bf025a20bc43339dfd15cec41adc1c13946, for
GNU/Linux 3.2.0, stripped
```
- `objdump -d a.out` produces the hexadecimal form along with assembly program

Why Is Compiler Construction a Relevant Subject?

Very few people write compilers any way

Conclusions

Octal Humour

- *“Why can’t programmers tell the difference between Christmas and New Year’s Eve? Because 25 in decimal is 31 in octal.”*
- *“We programmed it in octal. Thinking I was still a mathematician, I taught myself to add, subtract, and multiply, and even divide in octal. I was really good, until the end of the month, and then my check book didn’t balance! It stayed out of balance for three months until I got hold of my brother who was a banker. After several evenings of work he informed me that at intervals I had subtracted in octal. And I faced the major problem of living in two different worlds.”*

“That may have been one of the things that sent me to get rid of octal as far as possible.”

– Grace Hopper

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- *“Programming in the America of the 1950s had a vital frontier enthusiasm virtually untainted by either the scholarship or the stuffiness of academia.”*
- *“Programmer inventors of the early 1950s were too impatient to hoard an idea until it could be fully developed and a paper written. They wanted to convince others. Action, progress, and outdoing one’s rivals were more important than mere authorship of a paper.”*
- *“An idea was the property of anyone who could use it and the scholarly practice of noting references to sources and related work was almost universally unknown or unpractised.”*

Obstacles in Creation of a High Level Language

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:

- Priesthood wanted to preserve the order

“Priesthood wanted and got simple mechanical aids for the clerical drudgery which burdened them, but they regarded with hostility and derision more ambitious plans to make programming accessible to a larger population. To them, it was obviously a foolish and arrogant dream to imagine that any mechanical process could possibly perform the mysterious feats of invention required to write an efficient program.”

- There also were purveyors of snake oil

“The energetic public relations efforts of some visionaries spread the word that their “automatic programming” systems had almost human abilities to understand the language and needs of the user; whereas closer inspection of these same systems would often reveal a complex, exception-ridden performer of clerical tasks which was both difficult to use and inefficient.”

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- Adding instructions to the machine viz. floating point operations
 - Programmers had a library of subroutine
 - They needed to copy the subroutine on the coding sheets by hand and change addresses manually
- Grace Hopper added a “call” operation whereby
 - the machine would copy the code
 - and update the addresses

The A2 Compiler

Uday Khedker

The name “Compiler” was used because it put together a set of subroutines

The “Real” High Level Languages

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- Conrad Zuse's Plankalkul developed in a small village in Germany (1945)
 - “Program Calculus”
 - Only design, no implementation
(Computers were destroyed in world war II)
- Laning and Zierler's language for the WHIRLWIND at MIT (1953)
 - Fully algebraic in terms of supporting expressions
 - Very inefficient

Challenges for Creation of High Level Languages

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- The tyranny of OR
Expressiveness OR Efficiency
- Expressiveness:
Higher level abstraction, features not supported by hardware
- Most time was spent in floating point subroutines
 - Not much attention was paid to address calculation, good use of registers

Challenges for Creation of High Level Languages

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- The tyranny of OR
Expressiveness OR Efficiency
- Expressiveness:
Higher level abstraction, features not supported by hardware
- Most time was spent in floating point subroutines
 - Not much attention was paid to address calculation, good use of registers
- IBM 704 directly supported fast floating point operations
 - The need of expressiveness vanished revealing inefficiencies
Clumsy treatment of loops, indexing, references to registers
 - Led to rejection of “automatic programming”

The Genius of John Backus

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

He made the following important observations

- The main reason of inefficiency was a clumsy treatment of loops and array address computations
If that could be handled, things may be far different
- The possibility made a lot of economic sense
- Language implementation was far more critical than language design

IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

The Genesis of FORTRAN

- Motivation:

Programming and debugging costs already exceeded the cost of running a program, and as computers became faster and cheaper this imbalance would become more and more intolerable

- Goals: Can a machine translate

- a sufficiently rich mathematical language into
- a sufficiently economical program at
- a sufficiently low cost

to make the whole affair feasible?

The generated programs needed to be comparable to hand coded programs in efficiency

Uday Khedker
IIT Bombay

Conclusions

Limitations of FORTRAN I Language

- No reserved words
- Tokenization ignored spaces
- Simplistic functions
- No subprograms, no recursion
- No spaces
- DO loops with limited nesting depth of 3
- Implicit types based on the first letter
- No declarations required

Minor Errors Could be Rather Expensive

Uday Khedker
IIT Bombay

Talk Title:

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

Contributions of FORTRAN I Compiler

- Phase-wise division of work
- Optimizations:
 - Common subexpressions elimination,
 - Array address optimization in loops
(a form of strength reduction and induction variable elimination)
 - Register allocation using hierarchical regions
(optimal under number of loads for straight line code)
- Basic blocks and execution frequency analysis
- Distinction between pseudo registers and hard registers

Expressions in the Programs

- Other “algebraic” compilers needed parenthesis for expressions
- No concept for parsing using grammars

Expression	Expression Tree	Required Syntax
$a + b ** c * (d + e)$	<pre>graph TD; A((+)) --- B((a)); A --- C((*)); C --- D((**)); C --- E((+)); D --- F((b)); D --- G((c)); E --- H((d)); E --- I((e))</pre>	$(a) + ((b ** c) * (d + e))$

Uday Khedker

Conclusions

FORTRAN Rules for Expressions

1. Any fixed point (floating point) constant, variable, or subscripted variable is an expression of the same mode. Thus 3 and I are fixed point expressions, and $ALPHA$ and $A(I, J, K)$ are floating point expressions.
2. If $SOMEF$ is some function of n variables, and if E, F, \dots, H are a set of n expressions of the correct modes for $SOMEF$, then $SOMEF(E, F, \dots, H)$ is an expression of the same mode as $SOMEF$.
3. If E is an expression, and if its first character is not “+” or “-”, then $+E$ and $-E$ are expressions of the same mode as E . Thus $-A$ is an expression, but $--A$ is not.
4. If E is an expression, then (E) is an expression of the same mode as E . Thus $(A), ((A)), (((A)))$, etc. are expressions.
5. If E and F are expressions of the same mode, and if the first character of F is not $+$ or $-$, then $E + F, E - F, E * F, E / F$ are expressions of the same mode.

Conclusions

On compiler efficiency

- Frank Engel at Westinghouse observed that tapes moved independently but sequentially
- Compiler could become faster if tape movement is made to overlap
- Frank asked for the source and got a reply: (source meant assembly)
“IBM does not supply source code”
- Frank patched up the octal object code of the compiler and the throughput increased by a factor of 3!
- IBM was surprised and wanted a copy, so Frank said:
“Westinghouse does not supply object code”

A FORTRAN Program for Array Copy

Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

Observations about the inner loop

- Whenever j increments by 1, $t1$ increments by 10
- We can initialize $t1$ outside of the outer loop

$$\begin{aligned} t1 &= (j - 1) * 10 \\ &= 0 \end{aligned}$$

(because j is 1)

and increment it within the loop

$$t1 = t1 + 10$$

Compiling Array Copy Program: Strength Reduction (2)

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

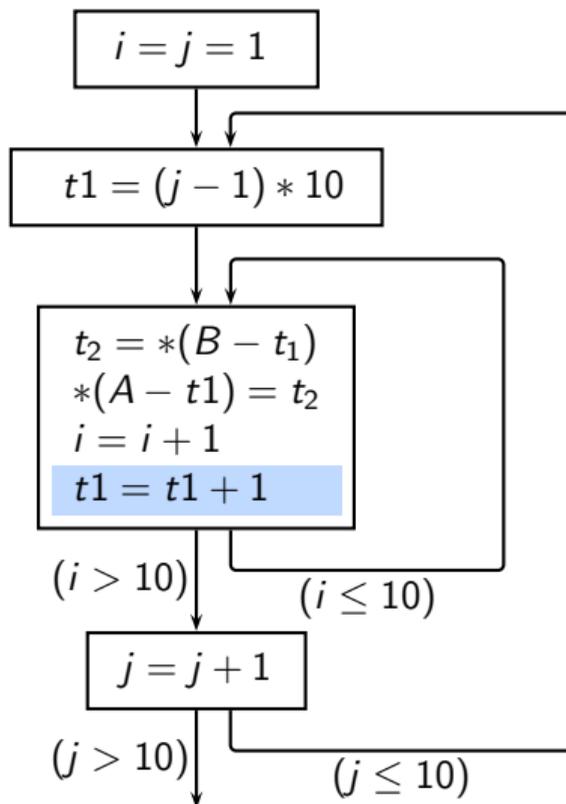

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

Observations about the inner loop

- Whenever j increments by 1, $t1$ increments by 10
- We can initialize $t1$ outside of the outer loop
$$t1 = (j - 1) * 10$$
$$= 0$$
(because j is 1)and increment it within the loop
$$t1 = t1 + 10$$
- However, the inner loop already increments $t1$ by 10.

Compiling Array Copy Program: Flattening the Loops

Compilation Models

Aho Ullman Model

Aho Ullman: Instruction selection

- over optimized IR using
- cost based tree tiling matching

Davidson Fraser: Instruction selection

- over AST using
- simple full tree matching based algorithms that generate
- naive code which is
 - target dependent, and is
 - optimized subsequently

Building a Compiler: Terminology

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- The sources of a compiler are compiled (i.e. built) on *Build system*, denoted **BS**.
- The built compiler runs on the *Host system*, denoted **HS**.
- The compiler compiles code for the *Target system*, denoted **TS**.

The built compiler itself **runs** on **HS** and generates executables that run on **TS**.

Variants of Compiler Builds

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

$BS = HS = TS$	Native Build
$BS = HS \neq TS$	Cross Build
$BS \neq HS \neq TS$	Canadian Cross

Example

Native i386: built on i386, hosted on i386, produces i386 code.

Sparc cross on i386: built on i386, hosted on i386, produces Sparc code.

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

- Language need not change, but the compiler may change
Compiler is improved, bugs are fixed and newer versions are released
 - To build a new version of a compiler given a **built** old version:
 - Stage 1: Build the new compiler using the old compiler
 - Stage 2: Build another new compiler using compiler from stage 1
 - Stage 3: Build another new compiler using compiler from stage 2
Stage 2 and stage 3 builds must result in identical compilers
- ⇒ Building cross compilers **stops** after Stage 1!

Uday Khedker
IIT Bombay

Talk Title:
Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

The Beauty and Enormity of Compiling

- Bridging the rather large gap between high and low level languages
 - Creating several layers of abstractions with smaller gaps
 - A great example of divide and conquer or stepwise refinement
- Developing and maintaining a rather large code base of millions of lines

Modern Challenges

Conclusions

Compiler design and implementation translates deep theory into general, efficient, and scalable, practice!

- Uses principles and techniques from many areas in Computer Science
 - The design and implementation of a compiler is a great application of software engineering
 - Makes practical application of deep theory and algorithms and rich data structures
 - Uses rich features of computer architecture

Translating Deep Theory into Affordable Practice

- Theory and algorithms
 - Mathematical logic: type inference and checking
 - Lattice theory: static analysis
 - Linear algebra: dependence analysis and loop parallelization
 - Probability theory: hot path optimization
 - Greedy algorithms: register allocation
 - Heuristic search: instruction scheduling
 - Graph algorithms: register allocation
 - Dynamic programming: instruction selection
 - Optimization techniques: instruction scheduling
 - Finite automata: lexical analysis
 - Pushdown automata: parsing
 - Fixed point algorithms: data-flow analysis

Conclusions

- How to efficiently compile
 - Dynamic features such as closures, higher order functions (eg. eval in Javascript)
 - Exceptions
- What guarantees to give in the presence of undefined behaviour
 - Memory accesses such as array access out of bound
- Designing analyses for features supporting parallelism
 - Doall, Async, Threads, Synchronization, Fork/Join, Lock/Unlock, Mutex, Semaphores
 - Some features enable parallelism in a sequential language whereas some enforce sequentiality on essentially parallel execution
- Designing analyses for extracting parallelism

Modern Challenges: Target Machine Issues

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

How to exploit

- Pipelines? (Spectre bug)
- Multiple execution units (pipelined)
- Cache hierarchy
- Parallel processing
(Shared memory, distributed memory, message-passing)
- Vector operations
- VLIW and Superscalar instruction issue

General strategy: Hardware software co-design

Modern Challenges: Target Machine Issues

Compiling-Challenges

Topic:
Outline

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

The crux of the matter

- Hardware is parallel, (conventional) software is sequential
 - Software view of memory model: Strong consistency
Every execution with the same input should give the same result
 - Hardware view of memory model: Sequential consistency
Result should coincide with some interleaving of threads
(Parallelism at the granularity of instructions in threads)
 - Modern architectures gives weak consistency
(Parallelism at the granularity of pipeline units of instructions, e.g., load/store buffering)
- Software view is stable, hardware is disruptive

Modern Challenges

Conclusions

A concurrent program

Initially $X = Y = 0$

$a = X$	$b = Y$
$Y = 1$	if(b) $X = 1$

- Variables a and b are thread-local variables
- Variables X and Y are shared global variables

Sequential Consistency preserves program order

$a = X$	$b = Y$	$b = Y$	$b = Y$	$a = X$	$a = X$
$Y = 1$	$b? X = 1$	$a = X$	$a = X$	$b = Y$	$b = Y$
$b = Y$	$a = X$	$b? X = 1$	$Y = 1$	$b? X = 1$	$Y = 1$
$b? X = 1$	$Y = 1$	$Y = 1$	$b? X = 1$	$Y = 1$	$b? X = 1$
$a = 0, b = 1$	$a = b = 0$

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

Modern Challenges

Conclusions

A concurrent program

To see the difference between sequential consistency and strict consistency, consider the following interleaving of two threads

`a = 0`

`a = 1`

`print a`

`print a`

- **Strict consistency.** Result of writes are available instantaneously

Both prints of `a` must read the value 1

⇒ Only one result is possible: 1, 1

- **Sequential consistency.** Result of writes may be available with a delay

The first print of `a` may read 0

⇒ Both 0, 1 and 1,1 are possible

Modern Challenges

Conclusions

A concurrent program

Initially $X = Y = 0$

$a = X$	$b = Y$
$Y = 1$	if(b) $X = 1$

- Variables a and b are thread-local variables
- Variables X and Y are shared global variables

Relaxed Memory Consistency allows violating program order

$Y = 1$
$b = Y$
$b? X = 1$
$a = X$
$a = b = 1$

- Order of assignments in the first thread can be interchanged
No thread-local data dependence
- Supported by out-of-order execution in processors restricted to a local view of the threads
- Being pushed in C standard in spite of the fact that it is difficult to understand for a programmer

Modern Challenges

Conclusions

A concurrent program

Initially $X = Y = 0$

$a = X$	$b = Y$
$Y = 1$	if(b)

- Variables a and b are thread-local variables

and global variables

Why is this useful?

Relaxed

Out of order execution offers more opportunities of keeping the pipeline full, thereby increasing the throughput

in order

can be interchanged

$Y = 1$
$b = Y$
$b? X = 1$
$a = X$
$a = b = 1$

- Supported by out-of-order execution in processors restricted to a local view of the threads
- Being pushed in C standard in spite of the fact that it is difficult to understand for a programmer

Modern Challenges

Conclusions

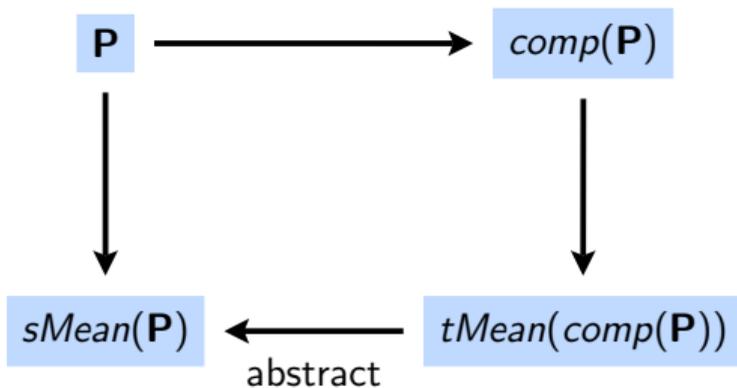

Modern Challenges: Providing Guarantees

- Correctness of optimizations
 - Hard even for machine independent optimizations
 - Verification of a production optimizing compiler is a pipe dream
 - Requires proving the correctness of translation of ALL programs
 - Compiler validation is more realistic, and yet not achieved fully
 - Allows proving the correctness of translation of A program
- Interference with Security
 - Optimizations disrupt memory view
 - Correctness is defined in terms of useful states
 - Clearing stack location by writing all zeros is dead code
 - Optimizations also disrupt timing estimates

Compiler Verification

Formalize and verify the following diagram for every source program P

$comp$ represents the transformation performed by

- a compiler (**harder problem**), or
- a model of the compiler (**easier**)

Is the model faithful?

What is a Compiler?

The Birth of a
Compiler

The Structure of
Modern Compilers

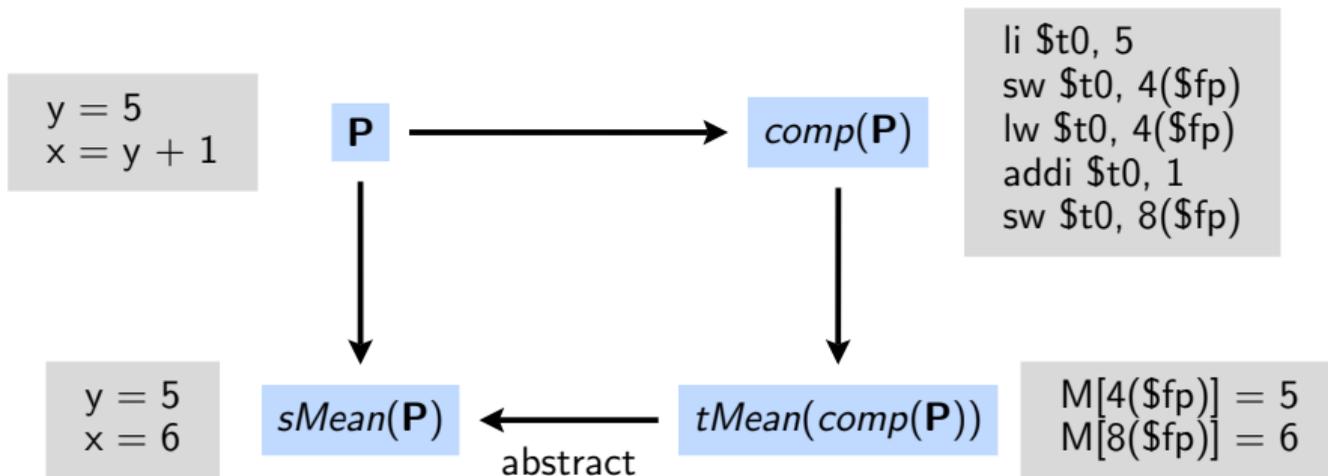

Modern Challenges

Conclusions

Difficulties in Compiler Verification

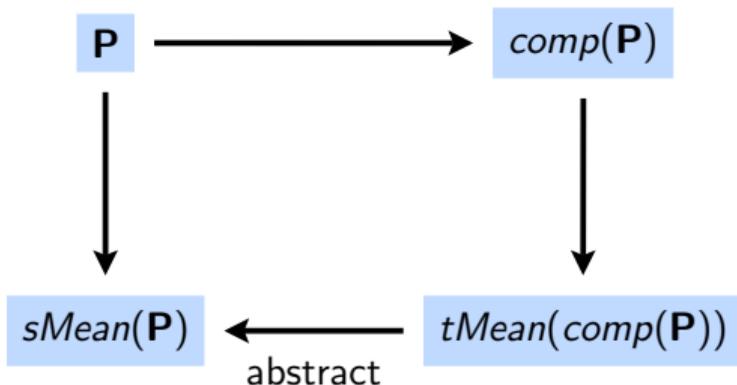

- Complexity
 - Requires reasoning about actual compiler implementation.
 - Requires reasoning about the behaviour of the compiler for an infinite number of programs and their translations.
- Automation - unlikely
- Proof reuse?

Modern Challenges: New Expectations

- New application domains bringing new challenges
- What are the underlying abstractions of the domains that should become first class citizens in a programming language?
 - Language design and compilers for machine learning algorithms?
 - Language design and compilers for streaming applications?
- Can machine learning algorithms help compilers create new optimizations?
 - Can human ingenuity in design of novel algorithms be replaced by machine learning?
Need explainability for guaranteeing soundness of new optimizations
Known cost based optimizations have a better chance with machine learning
 - Can compilers learn from the programs they have compiled and become “better” over time?

Modern Challenges

Conclusions

The Challenge Ahead

- Expressiveness Vs. Efficiency conflict due to the problem of scale
- Have we reached the Von Neumann bottleneck?
Backus argued so over three decades ago!
- At an abstract level, the status of compilers is similar to those in the John Backus era
 - Architectures not understood well enough for exploitation by compilers
 - Architectures influencing language features
 - Comparison with assembly
 - No past success story
